

I object to Gasfields

- The use of chemicals that are used in the fracking process
- The affect that these chemicals have on the artesian water reserves
- There is no need for gas we are a country abundant in sunshine instead of investments in gas all countries should be investing in renewables
- The gas that is produced is mainly for offshore sales while the impacts on our environment are massive, it is only greedy corporations that prosper while our landscapes, water tables and eco suffer in the long term
- Gloucester was able to stop AGL from going ahead with this the negative impact of gas has been reported worldwide in Oklahoma where fracking is used there are minor earth quakes on a regular basis.
- The impacts from the chemicals used on the water table are horrendous and these are documented this is fact not fiction it's just those in authority choose to ignore the safety impacts for their own prosperity and do not care about any of the impacts on those that have live near these gas fields, if those that like them so much want them they should have to buy the properties and live near these fields, instead they live 1000's of miles from where these fields are see no direct impact that these poor choices in fossil fuels make.
- There are other ways for countries to access methane, through using rubbish dumps and using the rubbish to produce methane, amazingly even America in California does this
- Oslo uses methane from its sewerage to produce methane that runs their buses for free and gives back to the citizens, instead in Australia we see the government reap royalties that never seem to actually prosper their citizens but only flow to their billionaire mates and ex politicians that have been selectively choose to sit on boards of fossil fuel companies e.g. Martin Ferguson, Mark Vaile – Whitehaven Coal to name a few that have prospered from being part of companies that governments seem to allow their companies licences without question.
- There is just no need for gas, it's detrimental, the renewable industry has been proven to produce more jobs and be more sustainable in creating employment. When is the stupidity going to stop on government continually granting these out of date type of fuels to be used. Coal and Gas have massively contributed to the alteration of our climate, doesn't it concern anyone that there is algae growing in Antarctica that has literally not grown for millions of years, how much more proof do climate denialists need for any meaningful change to happen.
- When are we going to get a to a world where ignorance wanes and we don't have to write and beg for reasonableness on those that control our lives and world to know better and make better choices for the planet as a whole instead of short term monetary gains for those of the privileged mate class. I find it astounding that Australia can accuse China of stealing state secrets and then be selling gas to them it's acceptable to be destroying our water tables and land for greed to a country that you don't even really like and lie and say about all the jobs that will be created when many of those jobs are really just short term or never eventuate. The cost to the farm land and agriculture who cares, until you need to eat right.
- Surely someone one day is going to see the impacts on our water and the detriment. You cannot keep taking from the water table and impacting the rivers like this and think there is no detriment. Try being in a drought and not knowing how you are going to water your animals and if think self isolating with covid is bad you have no idea of reality that's nothing ask farmers what it's like to have shoot their animals from lack of feed and water and you

want to allow gas fields that steal prime land and take precious water to be so full of chemicals and pumped back into the earth for gas. It just seems plain stupid and very far removed from reality. It's nothing more than greed and short sighted planning.
