Subject: STOP the Santos Narrabri Gas Project

Follow Up Flag: Follow up
Flag Status: Completed

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Marg Haenke

Subject: Submission of Objection: Narrabri Gas Project

Follow Up Flag: Follow up
Flag Status: Completed

Dear Sir/Madam,

I am writing to make a submission against the Narrabri Gas Project.

I ask the Independent Planning Commission to reject this project for the following reasons:

No need for more gas

Is this gas destined for the internal or export market? Is this part of a gas-led recovery strategy for our country? If for export, should Australia be party to contributing to carbon emissions by a) gas drilling and b) exporting our carbon emissions rather than investing in alternative energy sources for export.

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. We are highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

I am happy for my name and submission to be included on your website.

Subject: Submission: My objection to the Santos Narrabri Gas Project

Follow Up Flag: Follow up
Flag Status: Completed

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object strongly to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project.

My concerns are listed below.

1. IMPACT ON OUR CLIMATE

If we are to have any hope of keeping global heating below 2°C we cannot afford to burn large quantities of gas. Therefore there is no point in mining it.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy. It is also likely that fugitive methane emissions - another highly powerful source of global heating - will be underestimated.

Existing coal and gas fields will already push the world past globally agreed temperature goals. There is no room, or need, for more.

Further, the rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

So it is obvious that new gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Like many others, my family and I lived through several months of tension alternating with terror during the 2019/2020 bushfire season - something we never want to experience again!

@. THREATENED SPECIES

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

3. POISONING AND DEPLETION OF GROUNDWATER

Santos proposes to remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed. The Great Artesian Basin is an ancient, priceless and (in practical terms) irreplaceable asset for our farmers.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers.

Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

4. WE HAVE NO NEED OF MORE GAS

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, it would be more effective for governments to help them to transition away from gas by promoting electrification, using methods such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For all of the reasons I have outlined above I believe that the Narrabri Gas Project is unnecessary, potentially very harmful and should not go ahead .

Thank you for the opportunity to comment. I look forward to hearing from you in regard to my submission.

Yours Sincerely,

Margaret Hilder,
2790

Dear Sir/Madam,

My submission on the Narrabri Gas Project is in opposition to it.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below. The proposed extraction is an outrageous assault on the accepted science of climate change and the need to transition away from all fossil fuels to renewable energy generation ASAP to prevent the climate catastrophe that awaits us if we refuse to do so.

Climate impact

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Megan Robinson,

Subject: Submission of Objection: Santos Narrabri Gas Project

Follow Up Flag: Follow up
Flag Status: Completed

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Subject: Submission Objection: Protest Against Santos Narrabri Gas Project

Follow Up Flag: Follow up
Flag Status: Completed

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and request the Independent Planning Commission to reject this project. My concerns are listed below.

Impact on Climate

Succinctly, swap coal for gas and you still get the same devastating outcome for human life and the planet. Why, because gas like coal is also a major contributor to global warming. But invested companies are keen to make the short term profits nevertheless. It is impossible for anyone to enjoy wealth without a healthy planet to live on. There are very viable alternatives, ones that let our children have a real future on this planet as well as the other organisms that have survived millions of years of evolution, until now. It all pivots on human decisions and priorities. The Narrabri Coal Seam Gas Project is one of them.

If we are to keep global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

Subject: destruction of nature and climate is not what we need

Follow Up Flag: Follow up
Flag Status: Completed

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact- more use of gas locks us into a future of spiralling carbon emissions.

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species- nature and wildlife matters to me

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater- we cannot contemplate such an action in Australia

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas- renewable energy can do the jbb right now.

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Helen Church,
2107

Subject: Submission of Objection: Santos Narrabri Gas Project

Follow Up Flag: Follow up
Flag Status: Completed

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Suzanne Marks,
2050

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

To whom it may concern;

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I am a 34 year old mother of two small children. I vote. I pay my taxes. I am a business owner and I employ 22 people. I contribute to this society in the hope that it will continue to be a wonderful place to live for my children. Being part of a great society includes access to natural beauty, food security, and a future free of the dramatic effects of climate change.

As such, I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project. While I live in West Australia, I am a constant visitor to all parts of Australia and consider the entire country my 'backyard'.

I cannot bear to see yet another part of our natural environment and farming land put at risk - all for a short term gain that is questionable both economically and environmentally.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Jim Sharples,
2265

Subject: Submission of Objection: Santos Narrabri Gas Project

Follow Up Flag: Follow up
Flag Status: Completed

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

wendy sheehan,
2257

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Luke Johnstone,
QLD 4051

Subject: Objection to Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Subject: Santos Narrabri Gas Project a backwards step for Aust and the environment

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I absolutely object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate change

we have already seen the devastating impacts on our country and gas will only "fuel" these impacts.

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks, and we have access to renewable options

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater. Imagine an Australia with no koalas in the Wild, does not bear thinking about.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

As well the swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

Poison and deplete groundwater

Can anywhere in Australia afford to lose clean water .. I think not.

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Subject: Submission: Reject Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am concerned about the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact & Paris Agreement

In order to reduce the impact of global warming and to meet our obligations under the Paris Climate Agreement we need to keep gas in the ground. As we know even an increase of 2 degrees will be catastrophic for some of our Pacific nations who are already suffering from the effects of climate change.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

NSW needs to invest in renewable energy sources that offer cleaner energy and new job opportunities.

Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat that have decimated our national parks and treasured wild life. More gas extraction increases our exposure to climate risks.

Unacceptable Risk to Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater!

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

Increased risk of Koala extinction in NSW A recent report suggest that Koalas may be extinct in NSW by 2050. This is simply shocking! There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and Depletion of the Great Artesian Basin

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This project will bring ancient, contaminated coal seam water to the surface and may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

For these reasons I strongly object to the Narrabri Gas Project. The state of NSW is increasingly looking like an environmental vandal - from land clearing, to poor management of the bushfires to this latest gas project that

ultimately serves to line the pockets of a few gas executives at the cost of the environment. I urge you to reject this proposal.

Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Rachael Antony

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are as categorised below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground. That is a simple fact, and one which in all honesty outweighs any short or medium-term financial gain this project might provide (and the proposed financial gains are not certain anyway).

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions have almost always been underestimated as well. This is truly not acceptable.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room for more. Importantly, there is also no need for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas. This project is thus not necessary. Rather, it is a financial opportunity only, and with economically beneficial outcomes that only some people will benefit from.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. Critical to this is that more gas extraction increases our exposure to climate risks. Additionally, even the current COVID19 situation can be viewed as a result of environmental destruction, in this case the loss of wildlife habitat followed by human occupation and farming, leading to exposure to new species of infection. It is imperative that we begin undertaking genuine measures for environmental respect and protection.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater. Again, this is unacceptable.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species, and we cannot allow further decline of this nature simply to provide limited local jobs of uncertain duration and financial gain to a large corporation, at the expense of these species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna. Again, the conservation of this species is more important to Australia's longterm viability and wellbeing than is the short-term economic gains of the propose gas well project.

There have also been numerous koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and depleted groundwater

Santos will remove 1.5 gigalitres of water PER YEAR by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that will be harmful if leaked into the irrigation water in these aquifers.

In short, extracted water from the coal seams can quite easily contaminate the Great Artesian Basin aquifer, which local communities rely on as their water for stock, domestic and irrigation purposes. The dangers posed by toxic contamination is particularly important in light of the known fact that @8 - 10% of drilling wells have been shown to leak or even rupture, a side-effect of this type of extraction well known in the industry worldwide.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply. Australia does not need this gas and pays too much for it when it does use this gas!

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For all of these reasons I strongly object to the Narrabri Gas Project. I thank you for the opportunity to comment on this proposal too, and look forward to hearing from you in regards to this submission.

Yours Sincerely,

Tony Yeigh,

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission against the Narrabri Gas Project. I am happy for my name and submission to be included on your website if that helps my cause.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below - this is important also for you, your children, and our future as a human kind on this planet.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There cannot be any more. The rapid development of battery storage technology makes renewable energy sources (solar, wind, hydrogen) backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks, and puts vulnerable populations at greater risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

claire chatfield,
3099

Subject: Stop the Narrabri gas project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Subject: Chipping away at our last wildernesses: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I ask the Independent Planning Commission to reject the proposed Narrabri Gas project to which I must object in the strongest terms - for the following reasons:

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threat to natural biodiversity

The insidious destruction of the natural world on whose preservation we all depend. The Pilliga Project represents one more nail in its coffin.

While it is the whole ecosystem that needs protection, the Pilliga is habitat for a number of endangered species: a significant koala population and two rare bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project. I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. Some of my concerns are listed below.

CSG extraction is known to be detrimental to the environment, waterways, farming land and flora and fauna. To allow a company to exploit our land at the expense of the local environment, local people and the local economy especially in a dire time such as exists in 2020 would be criminally negligent.

Australia still has some unique animals but according to WWF research they are disappearing at the highest rate of any country in the world in this 21st century.

As a nation we also rely heavily on the farming economy to produce food needs for our country and for exports and this contributes to economic prosperity for the state and Australia.

CSG has the potential to undermine farming activities, destroy good farming land, pollute waterways and financially destroy the affected local population when their livelihoods are impacted by polluted land and water.

The habitat of native animals already dangerously impacted by loss of habitat will be further depleted. Native and domestic animals as well as humans may be adversely affected by polluted groundwater.

This is a dangerous method of gas extraction. Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath. This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

Santos claims to benefit the community because of the jobs it creates but very brief research shows that Santos has been involved in quite a lot of accidents leading to damage of the surrounding environment and persons in those areas.

Santos in 2008 was alleged to contribute or cause a large scale accident with the Sidoarjo mud flow in Indonesia adversely affecting 10,000 people and their homes.

Santos reportedly maintains it has "appropriate insurance coverage for these types of occurrences". That is not an environmentally responsible attitude. That will not quickly or adequately remediate the loss and damage to the land, animals or humans adversely impacted and it is uncertain whether land and water so damaged could ever be restored to to pristine condition. Destruction of habitat of species on the verge of extinction will likely push them closer to final permanent extinction.

Since 2008 further accidents have caused significant damage. In 2011, a 10,000-litre spill of untreated coal seam gas water occurred impacting native vegetation and soil in the Pilliga forest. Coal seam gas extraction produces water that can contain lead, mercury, various salts and other heavy metals. In 2013, groundwater monitoring detected elevated levels of salinity and heavy metals near Santos' Tintfield ponds in the Pilliga forest. It was reported that at

the Bibblewindi ponds, uranium 20 times above the safe drinking levels was detected. Later a report indicated the uranium was naturally occurring in the surrounding soil which was mobilised from the leaking pond. But it does not matter that Santos did not cause uranium to occur in the soil, the fact is Santos actions released uranium into the waterways and placed the environment at risk. Santos relies heavily on water for its operations and this multiplies the danger to a country where water is limited and fundamentally important to all both humans and animals as well as necessary for healthy vegetation. One company should not be entitled to such significant access to a valuable resource to operate CSG extraction which will be putting that water resource at serious risk.

I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,
Marieann Duncan

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Anthony Little,

Subject: Submission/Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I appreciate opportunity to make a submission on the Narrabri Gas Project.

You may include my name and submission on the inquiry website.

I strongly object to the proposed Narrabri Gas Project. I ask the Independent Planning Commission to reject this project. My serious concerns are : -

Climate impact

Very high temperatures are now being recorded in both the Arctic and Antarctic. Greenhouse gas emissions beyond the ability of the oceans and atmosphere to absorb them cause global warming. To keep a habitable planet, fossil fuels, including gas, must be kept in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining , and when the gas is burned for energy. It is now understood that the volume of fugitive methane emissions is likely to have been underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than extracting and processing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts - the recent bushfires, drought and extreme heat must be taken into account. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater. Koalas, after the widespread 'black summer' fires, are at greater risk than ever before. There are predictions the koala could be extinct in the wild in the next couple of decades.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species. Environmental offsets should be a last resort and only relied upon when there is positive evidence of the likelihood they might succeed. Environmental offset auditing is deficient.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers.

Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

Every effort needs to be taken to protect Australia's water, and the Great Artesian Basin.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification from renewable resources, and supporting investment in renewable energy. Corporations also bear responsibility to conduct their business in a manner that does not damage the environment.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Jane Touzeau

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Sharon Whitbourn ,

Subject: Narrabri Gas Project has the capacity to undermine safe water supply to a huge portion of critical safe water supply to essential farming areas, destroy native habitat of threatened species and divert necessary funds from renewable resources. It should...

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Subject: Santos Narrabri Gas Project Objection

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

These types of exploitation are NOT viable for several reasons:

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

We are all over what shall become our future. We can do very well economically if we let less mining/gas projects through as we simply grow business in areas we want to grow. We have to start somewhere, one project at a time. We need to become slowly less independent on these projects.

Yours Sincerely,

Karen Barlow 2382

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment.

PLEASE!

Siobhan Lowrey

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Lesley Strachan,

Subject: Objection to Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I strongly object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project.

I objected to this Gas Project in 2018. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species and communities

The project will impact on threatened ecological communities that we recorded in 2018 - Box Gum Woodland and Fuzzy Box woodland.

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence. There has been a big reduction in the numbers of koalas recently. The population is clearly under threat and the CSG project will put the final nails in the coffin.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Timothy Mullen ,

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Claire Stylian,

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Subject: Statement of Objection to the Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to express my opposition to the Narrabri Gas Project, which is shaping up to be one of the worst environmental catastrophes in Australia. Coal seam gas exploration and mining is banned in many countries around the world, including in Victoria. This is because of the record of irreparable damage already calculated across climate change impacts, ecosystem health, danger to wildlife and threatened species, and water systems.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project on numerous issues of extreme urgency. I ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger already fragile communities of koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater. We cannot continue to endanger these creatures.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Please save koalas and habitat for our future generations

Yours Sincerely,
Lee-Anne Sturgess

Subject: Objection to proposed COAL SEAM GAS MINING BY SANTOS in the Forest Wilderness near Narrabri

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

PLEASE don't do this. We have ample sustainable options for energy production and don't need gas. We do need to preserve the remnants of nature which are irreplaceable and are essential to maintaining the web of life on this precious planet.

Therefore I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

Follow Up Flag: Follow up
Flag Status: Completed

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project.

My concerns are listed below.

I have a PhD in environmental philosophy and have studied the history of the way in which mankind has ruined its environment, in its headlong abuse of resources, and coal-seam gas is just the latest in supposedly inexhaustible resources being plundered.

I am familiar with the Pilliga and Narrabri area, having lived in Armidale, climbed in Kaputar NP, and have been recently working in Tamworth.

The governments' relationship with fossil fuel companies is restricting any chance Australia has of restricting emissions. We have a ridiculous situation where we have a Covid response committee that has gas industry executives rather than economists, psychologists and sociologists.

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

If you have time, read this article by an economist about what is going to happen if we do not restrict emissions at a global level.

https://u3660919.ct.sendgrid.net/ls/click?upn=peEcKQiKvfjatWoHHCN9tEL6e-2Fy2CX8yu5-2FFzggJUPksB0ieQn4-2BCvtrvbjJgItVTr9KYAGsdXiHqEil1jy9Qz1tOe1-2BhKQo8u8q2ksb0pyLIKnhRAFam-2FB4vQ1OR0UGH9Fa2KfB60pY1bMZG8bQ-3D-3DiYGY_uwet8Qdks9BF2W378F9tpi7EdPT-2B5scQwDPsBgcWn28IsRMV3a7sAHsuBsbjzpzCd440pKnei3tzyXRmCRv-2FTwM96eidjBiwRNHFkBVUrcascprfJ8IKwHKyHAecWuPVvKa5uBEba9PO34onajipdVzLBUq9wywXiXqv8F917rJ33M5eAsmAl43G-2BvhTQOjQxih03X3TkY1N8Uz2Aav30HnKaYNLgL2sGCXpilaxNA-3D

Our emissions are 1.3% of the global total. But our population is 0.3% of the global total. And this is our emissions within Australia, when we export coal and gas, and other countries produce significant emissions to produce goods we import.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

In 2018, I was curator for The Art of Threatened Species Exhibition, a partnership between Orana Arts, OEH and Create NSW. I worked with 12 artists, 10 Scientists and a species in each of the regions in NSW. The Regent Honeyeater was one of the species we studied and I know it is critically endangered, especially due to coal mine expansion in its Blue Mountains habitats.

Studies suggest that the Koala, an iconic Australia animal, will be extinct in 30 years.

Hydraulic fracturing operations are already industrializing wild and rural landscapes, and putting agricultural and recreational economies at risk. Without rigorous safeguards, fracking will lead to poisoned water and blighted landscapes. Fracking also uses a lot of water. Each and every well requires millions of gallons of water – In arid places like the West, this could mean less water for fish and wildlife.

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

Ground water is another “inexhaustible resource” for humans to raid, with little thought to these reserves that were deposited in other geological times. Recent NASA studies using GRACE satellites have shown the depletion of the aquifers, made worse during the drought and which will be exacerbated by climate change.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers.

Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Dr Greg Pritchard

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Geoff Bradford ,

Subject: Environmentally Destructive Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Michael Stevens,
2017

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,
Genevieve Doran

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

Subject: Objection to proposed Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns include:

1. Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy. We also know that fugitive methane emissions are likely to be underestimated.

It's frightening to consider that existing coal and gas fields will push the world past globally agreed temperature goals. Why do we need more? The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. We know that more gas extraction increases our exposure to climate risks. The thought of another summer like the last one fills me with dread! I found it hard to breathe and I live in Sydney. What was it like for those surrounded by bushfires?

2. Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

3. Poisoning and depletion of groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

4. No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Anni Mill,
6036

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below:

Climate impact - this is the biggest issue for me and it affects all of us.

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops. I am personally working on making my home a gas-free home due to my concerns about climate change.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Cathy O'Callaghan,

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Nesta Luxton

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Alexandra Sayan,

Subject: Objection to Santos Narrabri gas project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am a part of a research group which researches energy transitions and one of the locations we have visited over the last few years is Narrabri. My speciality is renewable energy, and based on the recent maturing of variable renewable energy technologies and the evident social and ecological disruption of the Santos gas project in Narrabri, I do not think the gas project should be developed further. It is of utmost importance to avoid new fossil fuel projects, as gas is no longer needed as "transitional fuel", its (fugitive) emissions tend to be higher than previously estimated and the benefits of this project seem negligibly small to anyone, least of all to the NSW taxpayer nor to the environment in general. Below is the statement from NCC that I agree with, so I've copied that here as well.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Richard Miller,

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries and other renewable sources a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from this project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Robyn Hooper ,

Dear Commissioner,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

In the 1980s and 1990s I worked at the highest international level, with energy companies. Those decades were when ExxonMobil and Shell gave their warnings on fossil power use, that it must end. They are not withdrawn.

The world's best, the Australian Academy of Science and CSIRO, and like bodies, have given clear warning, for three decades, that fossil use must end, as soon as possible.

That warning included, some years ago, that 85 per cent of proven reserves should not be used.

The bodies giving the warning and the warning itself, binds all and therefore must be heeded.

Not to, is a classic and catastrophic, shooting the messenger, of a seminal truth.

Throughout that more than 30 year period, the vast 20/20 global eyes of the US National Oceanic and Atmospheric Administration and David Attenborough have seen the changes to date, only they are happening faster.

As you know, we cannot simply flick a switch, in ending fossil use, which should have started years ago.

Yours Sincerely,

Graeme Tychsen

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Ron Jacobson,
2117

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. I have a deeply ingrained memory of two weeks spent holidaying and investigating the wonderful natural history of this quite unique and beautiful part of Australia.

My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Dr Gregory D Kerr
24 Clarke St,
Hamilton Victoria 3300

Subject: Protect the Pilliga Forest!

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Subject: I Object to: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes. There has been farming in this local area for over 100 years and the threat to industries like cotton growth is substantial. Even a mild threat to our water supply is not acceptable.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project.

I have multiple concerns about the impact of this project, but I will limit my arguments to just one: the impact on water.

* The project will remove 1.5 gigalitres of water each year from the Great Artesian Basin.

* This will have a CATASTROPHIC effect on the water supply of local farmers who rely on it for stock, crops and to fight BUSHFIRES.

* It may also release poisonous chemicals and gases into the water that local communities rely on to DRINK.

Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours sincerely,

Tanya Humm

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurize the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have a negligible impact on domestic prices or supply.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Russ Graul,
2036

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

I want a future for my children and their children, and the environment and all the wildlife which deserve better than our past records of plunder and destruction.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Lynette Rajaratnam,
2350

Subject: Objection: Santos Narrabri Gas Project

Commission Members

This is a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project on multiple grounds and urge the Commission to reject this project. My concerns include:

Climate impact

We must keep gas in the ground if we are to have any hope of keeping global warming below 2°C

This gas field will release more than 90 million tonnes of greenhouse gases during mining and when the gas is burned for energy, including fugitive methane emissions which are likely to have been underestimated.

Mining and burning from existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more.

The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step backward in Australia's efforts to tackle climate change.

Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat.

More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to reduce gas consumption by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment.

I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Nigel Waters

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to express my opposition to the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I ask the Independent Planning Commission to reject this project for the reasons listed below.

Climate impact

The construction of a gas field will result in the release at least 94.2 million tonnes of potent climate pollution during mining. In addition, when the gas is burned for energy it will produce further emissions.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

As a result of this water removal, this project will bring ancient, contaminated coal seam water to the surface. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. This would cause harm to local communities that rely on this supply for water for stock, domestic and irrigation purposes.

Thank you for considering my submission.

Yours Sincerely,

Amy Baker,

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

No amount of money will ever make up for the loss of this precious part of nature or the devastating effect it will have on our climate.

Yours Sincerely,

{Jennifer} {Burger-Medway

Subject: Please save the Pilliga.

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I am so tired of writing to convince profit-obsessed, short-sighted men to protect the last remaining vestiges of our once amazing natural environment. There are species that these wells will wipe from the face of the planet. There are many, many more it will push ever closer towards extinction. They will damage healthy bushland and exacerbate climate change. They will pollute and reduce the life-blood of thousands of farmers and country people, the water in the Great Artesian Basin. WE CANNOT CONTINUE THIS WAY. We quite literally cannot. Healthy bush means healthy farmland and healthy people. No bush means no rain, no topsoil, no wildlife and no crops. And coal and gas are cooking the earth.

My concerns are discussed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Please remember, that once a groundwater supply is contaminated, it's purity cannot be restored; the damage, in every sense of the word is done. So please do not destroy this environment.

Yours Sincerely,

Adrian Rogers,
5118

Subject: Malcolm Shackleton

Dear Sir/Madam,

I am wish to make a submission on the Narrabri Gas Project. I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

We need to limit global warming to below 2 degrees centigrade but the proposed Narrabri gas field will release millions of tonnes of polluting gas into the atmosphere in the mining and burning of coal seam gas which will push the world beyond the two degree limit agreed upon by most nations.

Threatened species

Endangered Koalas and other mammals as well as endangered birds will be placed under further threat if this coal seam gas field gets approved and goes ahead. We cannot afford this.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

Sanity must prevail.

For the sake of humanity and the creatures we share the world with, sanity must prevail. A healthy society and economy is totally reliant on a healthy environment. Australia is already coping with a heavily degraded environment as it is without this extra burden.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Malcolm Shackleton

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

The area is home to threatened species such as the Swift Parrot and the Regent Honeyeater as well as koalas which are running out of natural habitat. By allowing Santos to go ahead with this project for private profit, you would be destroying never to be replaced woodland wilderness.

Australia is blessed with the ability to harness solar and wind power which can now be stored with ever more efficient batteries. To pretend that gas is some sort of magic halfway technology is insane, when the world is teetering on the edge of climate catastrophe.

Surely the past summer with its terrifying fires indicates how dangerous is Australia's situation in the face of global warming. I cannot fathom why money in someone's pocket is more important than the safety of all of us on this planet.

Water is another vital resource, which should not be endangered by allowing wells to be dug into the Pilliga sandstone aquifer.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Marja Harris,
7050

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

Subject: Objection to Narrabri Gas Project

Dear Sir/Madam,

I wish to make a submission on the Narrabri Gas Project. I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns follow:

Climate impact:

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species:

This project will seriously endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poisoned and depleted groundwater:

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers.

Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas:

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project. I really am struggling to understand how any government could willfully put at risk the livelihood of Australian farmers, the production of Australian crops/meat/wool and the integrity of any life sustaining environment by green lighting this devastating project. Please, please be the sane and educated people you must be and reject this project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Subject: Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I write to make a submission on the Narrabri Gas Project.

I am happy for my name and objection to be included on your website.

I strongly object to this Narrabri Gas Project (as proposed) and ask the Independent Planning Commission to completely reject this project. My concerns are listed below.

Climate impact

To have any hope of keeping global warming below 2°C we must keep gas in the ground.

This "Gas Field" will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger Koalas and two rare and iconic bird species - the Swift Parrot and the Regent Honeyeater.

The Swift Parrot is critically endangered.

The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The Regent Honeyeater has become an icon for birdwatchers in NSW.

It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers.

Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have a negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off the gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Matt Bonner,

Subject: Santos Narrabri Gas Project – Objection Submission

Dear Sir/Madam,

I am writing to you to make a submission on the Narrabri Gas Project - an objection submission!

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns and surely every Australian's concerns are as listed below:

- * The impact on our Climate can't be anything other than detrimental
- * We must keep global warming below 2 degrees celsius - burning fossil fuels is not the way to do this - the science shows this without doubt - gas needs to stay in the ground.
- * My understanding is this gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned to produce energy - and emissions will further add to the damage.

Australia is in a unique position to develop renewable energy - wind, water and solar - and with the rapid development of effective battery storage it is the way of the future and ultimately could create a cleaner and cheaper energy industry. Australia could be a leader - this is our opportunity.

Existing coal and gas fields will push the world past globally agreed temperature goals - mining will not assist Australia's economy out of it's current economic slump - a new industry in the delivery of renewal energy can!

New gas production is unnecessary and will not help Australia's efforts to tackle climate change - Australia will go backwards and after this last bush fire season that is not where we want to go - imagine an even more extreme drought, bushfires across the country - this is not the way of the future.

More gas development puts Australia at risk - it needs to be stopped!

The drought followed by the massive bushfires across the state decimated our native wildlife. This project will push our koalas to extinction (which is where they already are) and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

- * Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes. The evidence of coal seam gas extraction poisoning ground water is well documented around the world - it will happen if this project goes ahead. And I quote from a recent submission - "A man who really knows mining is the recently retired CEO of Woodside, Mr Don Voelte. When stepping down recently after six years at the helm of this big mining company Mr Voelte said he believed his biggest achievement was stopping Woodside being involved in coal seam methane extraction."

The New South Wales Government would be better off encouraging business and households to transfer from using gas if potential gas shortages is justification for approving this project. Heat pumps and reverse-cycle air-conditioning is cheaper and more energy efficient than gas - and can be delivered by renewable energy.

For these reasons I strongly object to the Narrabri Gas Project. **STRONGLY OBJECT!!!**

Thank you for the opportunity to comment. I am happy for my name and submission to be made public if required and look forward to hearing from you in regards to this submission.

Yours Sincerely,

Catherine Bateson
Annandale, NSW, 2038

Subject: Submission of Great Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Personal Experience

I first visited the Pilliga area three years ago and was amazed to see the size of forest being the size of Belgium. This is rarer than rare, this is something once destroyed or changed will never be the same in anyone's lifetime. It is not worth it, not for anything.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Sally Browne

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Subject: Strong Objection: Santos Narrabri Gas Project

Follow Up Flag: Follow up
Flag Status: Completed

Dear Sir/Madam,

I am writing to make a submission on the proposed Narrabri Gas Project.

I object in the strongest terms to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

1. Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

2. Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

3. Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

4. No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For all these reasons, I strongly object to the Narrabri Gas Project.

Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Dr Jean (aka Jeannie) Higgins

I would have thought over the past year we would have lost large tracts of habitat to drought and fires and we must not lose more to this type of project as the land will eventually recover from the natural damage but not the intense damage caused by what is planned by Santos.

Yours Sincerely,

{Alan} {Stephenson},

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

{Don Kerr,

Subject: Please protect our wilderness areas.

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Chloe Bayley,

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

Having spent many years in the central west regions and seeing the devastation wrought on the landscapes to advantage private companies, I believe this unnecessary project should not proceed.

I have read the format message following and totally agree with all of the statements. For the good of our health and our planet please do not allow this proposal to go ahead.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Ferry Tiu,
2208

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Poison and deplete groundwater

I am particularly concerned about contamination of the aquifer and the pollution of ground surface as already occurred during exploratory drilling.

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. When are we going to learn and abandon this unnecessary madness?

Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

David Temple

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to lodge an objection to the proposed Narrabri Gas Project and I ask the Independent Planning Commission to reject this project outright.

The Climate impact of new gas developments like this make them totally unconscionable. For goodness sake, we already have unprecedented extreme weather events within Australia and across the globe, from summers of fire here to 38c heatwaves in the Arctic. We can't keep exploiting and expanding fossil fuels the way we are!

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

Destroy nature and eventually we disappear with it. You will already be well-informed of the native mammal and bird species that depend on this habitat. Don't kill them off by compromising the environment they absolutely depend upon. Santos is not worth the loss of any of our iconic native species.

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers.

Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

Why this gas? Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

Thank you for noting my highly valid grounds for objection.

Yours Sincerely,

Dr Bruce Adams

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Jesiah Davis,
2484

Subject: Please do NOT ALLOW coal seam gas in the Pilliga forests :

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Bryn Soden,
5051

Subject: Please do not proceed with destroying the Pilliga, Narrabri

Follow Up Flag: Follow up
Flag Status: Completed

Dear Sir/Madam,

Thank you for the opportunity to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I wish to express my strong objection to the proposed Narrabri Gas Project and I seek the Independent Planning Commission to reject this project.

I am deeply concerned about the impact of the proposal to accelerate the climate change emergency. Natural gas, along with coal, needs to remain in the ground if we have any hope of keeping global warming below 2°C. We are on the cusp of global climate instability and it is urgent every agency of government take action on addressing the root causes of climate change - the mining and burning of gas and coal. It is unacceptable that at least 94.2 million tonnes of dangerous climate pollution will be released if this mine proceeds.

There are real concerns that if this proposal proceeds it is a criminally negligent action as it will be against the spirit of Australia's commitment to reduce greenhouse gas emissions as promised at the Paris Climate Conference.

The real, genuine and scientifically strong fear is that proceeding with mining of coal and gas fields will push the world past globally agreed temperature goals - making the planet unliveable for life. We must abandon the pursuit of money to ensure that we have a liveable planet. Instead the rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

This project must not be approved as it will exacerbate Australia's climate crises. We witnessed the unprecedented catastrophic bushfires of 2019-20 bushfires along the entire south eastern coast of Australia. We cannot allow this to happen again - and approving this mine, will accelerate more climate disasters.

More gas extraction increases our exposure to climate risks. It is time to stop this mad addicted economic suicide.

I believe strong action must be taken to stop the extinction of Australia's wildlife that includes koalas and the swift parrot and the regent honeyeater. These species, and many others, will die out, if this mine proceeds.

We must do everything in our power to protect the swift parrot that is so close to extinction.

The coal seam gas mines will destroy habitat that and escalate extinction through habitat loss.

We also must do everything to protect the regent honeyeater that is also so close to extinction.

Koalas live in the Pilliga East State Forest. They must be protected by rejecting the coal seam gas project. Why do we always want to destroy wildlife's rights to a home?

Water is the nation's most precious resource - far more valuable than multi-billion dollars. Yet we risk ecological collapse of the Great Artesian Basin if Santos is allowed to mine and by the 850 wells removing 1.5 gigalitres of water per year. Once the Great Artesian Basin is destroyed, it cannot be destroyed. Nor should we allow our rivers and waterways to be polluted by the inevitable flows of contaminated coal seam water that comes with the mining.

Farmers cannot survive if the Great Artesian Basin water is compromised by the mining.

COVID-19 is a game changer. We now have to implement sustainable energy - and gas is not one of them.

I sincerely ask that you listen to the voices of the community and the voices of reason and reject the Narrabri Gas Project.

Yours Sincerely,
Janine Kitson

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

Deciding to increase the production of gas at this time of Corona crisis will be perceived as a response to lobbying and opportunism.

To have any hope of keeping global warming below 2°C we must keep gas in the ground.

The impact of fugitive methane was well documented more than 5 years ago. The passage of time and our preoccupation with other problems does not negate those findings. This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy. Fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This particular project will endanger koalas and two rare iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered and the situation was worsened by the summer bushfires. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project. All my long life (I am now 83 years of age) I have loved the natural environment and the birds and animals who live in it. The natural environment is an ecosystem in which the human species evolved and in which many find restorative powers to help them cope with the stresses and strains of living in this overcrowded planet. To destroy this resource in the pursuit of profit is unnecessary when alternatives are available and under development to meet our energy needs.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Dawn Linklater

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

I am told that as presently planned this gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and further fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. and of course the destruction of our sea platforms and reefs. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

As an older member of the community i have seen our land detroyed bit by bit. My memories of this beautiful country are disappearing .It has coming to the stage where there will be very little to show to the generations to follow. It will be your children and grandchildren who will be affected by the decisions you have made. Very little of any so called financial gain will go to the people of Australia. It will be all our loss, and the world's loss if this project is allowed to go ahead.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

SUBMISSION RE NARRABRI GAS PROJECT

I am happy for my name and submission to be included on your website.

I strongly object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project for the following reasons.

Global Warming

To keep global warming below 2°C we must keep gas in the ground.

This gas field would release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields would push the world past globally agreed limits. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Pollution and depletion of groundwater

The Santos project would remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

I understand that funding for political parties is what is influencing a serious focus on alternative energies such as solar and wind. However the need to diversify to protect land and the environment is greater than immediate dollars. Australia can become a leader in alternative energies with great scope for exporting. Many more jobs are created in these industries than the few jobs in mining and gas extraction.

Yours Sincerely,

Olga Teran

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

We need to keep gas in the ground to avoid more warming of our planet and keep below 2°C. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

It is devastating to realise figures are showing at least 94.2 million tons of potent climate pollution during mining plus gas being burned for energy; the escaping methane emissions are likely to be underestimated. It is clear that existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. As what happened December 2019/early 2020 Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

I feel strongly against this project as it will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

All governments seem to think that wildlife does not matter but they provide a service to our plant via seed distribution, keeping the earth clean, in fact we need them - once it's all gone what then?

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers.

Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. Please consider carefully your actions.

Yours sincerely,

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Malcolm Unicomb,

Subject: Renewables and forests, no more coal

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project. I am happy for my name and submission to be included on your website.

My husband spent a lot of his youth around Narrabri, including in the Pilliga Forest. Obviously it is a much bigger issue than this for us, however. We live on the driest continent on earth (water in danger with Narrabri Gas Project); we need more trees, not fewer (trees in danger); we have so many native creatures facing extinction (habitats in danger); our country is extremely vulnerable to climate change (whole country in danger). We haven't forgotten last bushfire season. We dread the thought of more of the same.

Who would risk all this - our entire future - for the sake of an energy source that is plainly less desirable in every way than alternatives already on offer; and prattle about jobs which will be short-term, destructive, and minimal in number (especially when compared with opportunities also clearly available)?

I therefore object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Marcille Cameron,
2130

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact will be exacerbated by the burning of the gas mined, over the life time of the gasfield, c.94m tonnes of eCO₂. The proposed fracking threatens the integrity of the aquifers in the area used by the native forest and agriculture. The water taken by the CSG mining from the Great Artesian Basin aquifers will be considerable amounting to some 1.5Glitres per year.

Fracking can also add to fugitive emissions both in the pipeline and pumping station venting and escapes, now known from recent US research to be many times more than the earlier EPA models indicated. There is too little baseline and subsequent monitoring of fugitive methane and other greenhouse gas emissions in Australia.

Fracking also can open up fault lines increasing gas emissions through the ground to the surface away from the initial well. Other seismic events that occur and are not often recorded are earthquakes and subsidence that occurs as the gas seam is dewatered. The earth quake phenomenon is the factor that led to the banning of fracking in France and the restricted use in the UK.

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Wildlife will be endangered by the proposed 850 wells, from habitat disturbance including endemic species such as koala, Regent Honey Eater, Swift Parrot.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Dear Sir/Madam,

I am writing to object strenuously to the Narrabri Gas Project, and to ask the Independent Planning Commission to reject this project.

After the unprecedented fires of the last summer, our unique native flora and fauna are under more pressure than ever. Changing climate also makes these kind of natural disasters more likely in the future, and natural gas is demonstrably a contributor to global carbon emissions and global warming. This proposal, therefore, compounds immediate wilderness destruction with long term damage to both local and global ecological health.

- This gas field will release at least 94.2 million tonnes of potent climate pollution during mining alone, plus more when the fuel is burned.
- There is no valid economic argument for additional fossil fuel extraction. Renewable energy sources are now more economical on a national scale than the (heavily subsidized) fossil fuel industry. Moreover, a balanced costing which took into account the true economic harm of climate change would demonstrate that we as a nation cannot afford new gas production. It is an unnecessary and dangerous step in Australia's efforts to tackle climate change.
- The project will destroy some of the little remaining habitat of many native species, including the critically endangered swift parrot. Koalas are also facing critical threats due to habitat loss, and the East State forest is a priority area for koala conservation.

These are but a small selection of the potential ecological harms wrought by new gas field developments in this area. I therefore strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment.

Yours Sincerely,
Dr NE Carey

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I have been a visitor to Narrabri since I was in primary school.

I have now had the pleasure of taking my children to your very special part of the world. We have shared many picnics there while traveling to Sydney.

Please consider other ways of generating energy and creating jobs. There is abundant information available now to show how the desecration of environments negatively impacts ecosystems.

It is time companies invested in clean energy generation systems. Loans have already been refused to the Queensland Government because they continue to invest in fossil fuel energy generation systems. The New South Wales Government has an opportunity to lead the way in clean energy alternatives in Australia by declining this project.

Please consider our children's futures. They should not have the burden of rectifying environmental damage on top of the other challenges they will now have to face.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours sincerely

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops. I already have all of these installed in my home. This company has already polluted, please consider this in your findings.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Subject: Our future needs saving, NOT coal seam gas

Dear Sir/Madam,

I am writing to implore you to stop the coal seam gas project at Narrabri.

I am happy for my name and submission to be included on your website.

As spokesperson for Australian Architects Declare a Climate and Biodiversity Emergency, I am deeply concerned that your project will have devastating impacts on both climate change and biodiversity.

If we are to have any hope of keeping global warming below 2°C we must stop burning all fossil fuels. This means we need to keep gas in the ground.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Additionally, this project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. The swift parrot is critically endangered. The regent honeyeater is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

In our dry arid country where water is an extremely precious resource, Santos will remove 1.5 gigalitres of water per year. This will be done by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Caroline Pidcock,
2000

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Elaine Oberg,

Subject: Stop the Narrabri Gas Project - For the future of our children

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Jessica Forbes
Western Australia

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

An Australian owned company should do more to protect all that we have instead of putting the almighty dollar first.

Yours sincerely,

Carol Easton

Subject: Re: Submission of Objection for the Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission about the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are as follows:

Climate impact

If we are to keep global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during extraction and through the burning of the gas for energy. Dangerous fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought, and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers.

Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic, and irrigation purposes.

We all rely on our farmlands for our food, it is completely inappropriate to consider granting approval to a project that threatens water, food and the climate.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating, and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regard to this submission.

Subject: Submission of Objection: Santos Narrabri Gas Project - Water is Life

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

This all adds up to protecting our whole eco-system.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

Finally, I want to leave our world in a better place for my descendants, for the current path we are on, will make our planet more susceptible to worse climatic disasters.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Judy Schneider,

Subject: Please don't allow Santos Narrabri Gas Project

Follow Up Flag: Follow up
Flag Status: Completed

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I feel like my family and I have been protesting this issue for decades, ever since the last time SANTOS left the poor forest in a terrible toxic state, with dead animals and plants everywhere, just as is done in the northern desert areas.

We are at the crisis point in the world for saving our environment and our future. Putting a stop to this project would be a major step towards a clean and vital future for Australia, a land where we have abundant sun and wind and hydro and thermal - SANTOS should have diversified decades ago - the writing has been on the wall for that long.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My family and I agree with all the concerns listed below as researched by experts with no ulterior motive but to save Australia from destruction because of short-sighted, ignorant profiteering.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

lili perez,
7250

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Subject: Narrabri Needs to be Preserved

Follow Up Flag: Follow up
Flag Status: Completed

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

There is now ample scientific evidence demonstrating the environmental damage sustained through fossil fuel energy generation.

It is so important to preserve our flora and fauna, particularly after the disastrous 2020 bushfires.

It is time to start investing in clean energy generation and to create jobs in this area. Australia needs to be a leader in this area rather than perpetuating environmentally-comprising industries like coal and gas energy generation.

Please think of our children: we have an opportunity here to not desecrate the environment they will live or burden them with the problem of rectifying the damage caused to the flora and fauna by the gas wells.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My objections are based on 3 main aspects or impacts of the project; it's destruction of precious forests which are koala habitat in a very vulnerable ecological environment, the threat to our fragile water supply and one of Australia's most significant and uniquely large artesian water sources and its impact as far as increasing Fossil fuel emissions.

This project will tear through a forest that is a priority area for koala conservation and home to two rare, iconic and critically endangered bird species — the swift parrot and the regent honeyeater.

It will remove 1.5 gigalitres of water each year from the Great Artesian Basin, threatening the water supply of local farmers who rely on it for stock and crops.

And it will release 94.2 million tonnes of potent climate pollution during mining and when the gas is finally burned.

To give these three rationales more detail:

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project.

The contribution to global warming from all this gas is in a word, outrageous.

If we are to have any hope of keeping global warming below 2°C we must keep gas, coal and oil in the ground.

This project will endanger koalas and other wildlife, There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation.

A major, major danger is that Santos will remove 1.5 gigalitres of water per year drill through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin.

Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

It is unthinkable to damage this artesian basin.

Governments should help New South Wales to get away from gas by promoting electricity produced by solar and batteries.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment.

Yours Sincerely,
Roger French, postcode 2745,

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Hiliary Chow,
2113

Subject: Absolute Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact
sink hole formation
underground water poisoning

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

To the IPC,

I am writing to make a submission on the Narrabri Gas Project.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

If you approve of the Narrabri coal seam gas project, you will be responsible for the unnecessary destruction of our land, the poisoning of our water supplies and the extreme loss of biodiversity.

The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

Please oppose the Narrabri Gas Project.

Yours Sincerely,

Simon Croker

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like the bushfires, drought and extreme heat, as we all witnessed in 2019. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies state forests as a priority areas for koala conservation. Koala skulls have been discovered in the project area, which is further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if and when they leak into the water in the aquifers which is used for irrigation, stock (animals) and potentially for many other human uses.

Extracted water from the coal seams is very likely to contaminate the Great Artesian Basin aquifer. These risks are far greater than any benefits of extracting the coal seam gas, even if economic demand can be shown, even if great profits can be made and employment opportunities identified. There are more lucrative benefits in developing renewable energy alternatives instead of disturbing coal seam gas.

Local communities rely on this supply of water for stock, domestic and irrigation purposes.

There is No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops, all of which can be fuelled by solar energy and storage batteries.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

{Bert} {Jenkins},
{2350}

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. I have visited the Pilliga Forest area and cannot conceive of anyone allowing such desecration as will follow the proposed coal seam gas project.

As well if we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. As last summer showed Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Furthermore this project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater. There have been koala sightings in the Pilliga East State Forest and the Western Woodlands Alliance classifies that state forest as a priority area for koala conservation.

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath. This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed. This is alarming as extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

I strongly object to the Narrabri Gas Project for these reasons and I am sure there are more. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Margot Pearson

Subject: Environmental Catastrophe

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground. This decision by the NSW Government puts Australia firmly into the realm of an international laughing stock. When other countries are forging ahead with renewables Australia is steadfastly following the same Noah's Ark backward push for climate wrecking fossil fuels. Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission. Australia's treatment of our iconic koalas is a national disgrace. The rest of the world is watching and taking an interest in our wildlife as evidenced by the huge outpouring of international support during the recent bush

Yours sincerely,
Vivien Rothwell

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,
Richard Stanford

Subject: New South Wales

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

{Lorraine Falkner

Subject: Objection to the Santos Narrabri Coal Seam Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I strongly object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Fragmentation of remnant vegetation:

This project with its well sites and network of clearing for connecting roads and pipelines as well as increased vehicle movements will further fragment one of the largest remaining areas of native vegetation in the Brigalow Belt South (BBS) bioregion. The BBS in which the Pilliga Forest lies is one of the most overcleared bioregions in NSW, with an estimated 24% woody vegetation remaining in 2002 (NSW NPWS 2002, BBS Scoping Report). This level of land clearing makes large remnants such as the Pilliga Forest critical to the continued survival of many of our native plants and animals. To further fragment this remnant for this project will place at further risk of extinction many species including already listed threatened species.

Threatened species:

This project will further endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

Koala records exist in the Pilliga East State Forest and the Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence. Given the NSW koalas and their habitat were so badly devastated by this year's bushfires, it behoves the government to protect their habitat wherever possible. Allowing further clearing, fragmentation and increased vehicle movements will be detrimental to koala populations within the Pilliga.

The swift parrot is listed as critically endangered under Commonwealth legislation and endangered under NSW legislation, with known records in the Pilliga Forest. The total swift parrot population is estimated to be less than 1000 pairs. On-going habitat loss is recognised as a contributing factor in the decline of this species. Consequently the Swift Parrot Recovery Plan identifies increasing the extent and quality of habitat as essential to its recovery.

Similarly the regent honeyeater is listed as critically endangered under both NSW and Commonwealth legislation. This woodland bird with known records in the Pilliga East State Forest is estimated to have less than 400 adult birds remaining. Like the Swift Parrot, on-going habitat loss is recognised as a significant factor in this bird's decline. As a result increasing the extent and quality of habitat is identified within the Regent Honeyeater Recovery Plan for this species as essential to its recovery.

Given the conservation status of these species and their known occurrence within the Pilliga Forest, protection of areas of their remaining habitat should be a governmental priority. Permitting further clearing, fragmentation and disturbance to their habitat would appear inconsistent with the published recovery plans for these species. Further conserving habitat for these iconic species will benefit a large suite of other threatened and declining woodland fauna in western NSW.

Climate impact:

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Poison and deplete groundwater:

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission objecting to the Narrabri Gas Project.

I agree for my name and submission to be included on your website.

I strongly object to the proposed Santos Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

1. Climate impact

Extracting yet more sequestered carbon will further degrade the possibility of arresting global warming at no more than 2°C above the historic average.

This gas field will release at least 94 million tonnes of potent climate pollution during mining and when this gas is burned for energy. Furthermore incident fugitive methane emissions can be expected to amplify damage to the biosphere..

The IPC must not assess this project on simplistic economic terms that are favourable to the promoter of the project. The public interest must be served with the broadest possible terms considered.

2. Threatened species

Approval of this project will negatively impact koalas and two rare iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs with habitat loss clearly a primary contributing factor in the decline of this species.

Widespread damage to previously coherent and connected area will have far reaching and likely irretrievable impacts such as loss of diversity and collapse of balanced systems. This long term perhaps irreversible harms must not be accepted simply for a short term proposition by a single party.

3. Groundwater impacts

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This type of activity whilst not directly observed in the short term can have widespread and crippling impacts on parties far outside the project footprint.

Simply there is no case made for producing yet more gas.

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australians from gas supply shortages, all governments must encourage reduction in demand rather than abrogate responsibilities by acceding to the narrow interest of Santos.

For these reasons alone I strongly object to the Santos Narrabri Gas Project. Thank you for the opportunity to comment and I look forward to hearing from you in regards to this submission.

Yours sincerely,
Frank Hamersley

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Fracking is an abomination!

Yours Sincerely,

Evan Jones,

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

Subject: Objection Submission for Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

We need to move away from fossil fuels quickly, if we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

With more intense bush fires likely. This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

These wells are poisoning the environment and taking precious water, this is crazy stuff.

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Please consider the long term affects to our farmers, environment and native animals and stop this disastrous project.

Yours Sincerely,

Robyn Walsh,
2848

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Subject: Objection to Santos' proposed coal seam gas field in the Pilliga Forest near Narrabri

Dear Sir/Madam,

I am writing to make a submission on the proposed Narrabri Gas Project to which I strongly object to and I ask the independent Planning Commission to reject this project.

My objections to the project are in relation to the environmental destruction to underground water supplies, to the atmosphere by the release of carbon dioxide, methane and other polluting gases and the destruction of habitat for threatened species known to be in the Pilliga Forest wilderness. The project threatens to poison and deplete the water in the Great Artesian Basin that many states and their agriculture depend on.

Therefore, I urge you to reject this coal seam gas project which is completely unnecessary and which can have devastating consequences now and well into the future.

Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Carol Scantlebury,

Subject: Submission of Objection to the Santos Narrabri Gas Project

Dear Sir/Madam,

I am making a submission on the Narrabri Gas Project, specifically that you do not give approval for it. I am happy for my name and submission to be included on your website.

My objections are based on the following concerns.

Climate impact

Global warming this decade has exceeded the estimated increase made ten years ago. Climate scientists have warned that we must act now, not in a few years time, if we are to have any hope of keeping global warming below 2°C.

The Santos gas project will release at least 94.2 million tonnes of greenhouse gases during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There has been rapid adoption of renewable electricity generation together with battery storage along with steadily decreasing cost in Australia in the last decade. If government policy was based on economics, this adoption would accelerate.

Thus, there is no need for more gas production, which destroys Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Contamination and depletion of groundwater

The chemicals used in coal seam gas extraction have contaminated ground water in many parts of the world. There is no independent evidence that this will not happen in the Pilliga.

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath. This is 2.3% of the water stored in the whole Basin. Recharge rates for the Basin are argued, but in the best case scenario are still less than the Santos extraction.

Thus, Santos's removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

In addition to the contamination from extraction chemicals, this project will bring ancient, contaminated coal seam water to the surface. The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers.

Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

Threatened species

The disruption to the Pillaga affect the habitat of many animal and plant species. It will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

Conclusions

There is no need for more gas. This project would contribute to climate change from the release of methane from wells and from the burning of the gas.

Alternative renewable sources of energy are now less expensive than gas and more reliable than coal.

Apart from threatening all ecosystems through climate change, this project threatens the water supply from the Great Artesian Basin and the environment of the Pillaga.

Recommendations

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

(Dr) Gordon M. Murray

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Nicole So,
2067

Subject: Stop the Santos Narrabri Gas Project!

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

My name and submission is encouraged to be included on your website.

I wholeheartedly object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Most of all, Climate impact.

Global warming must be halted as soon as possible and in order to have any chance of keeping warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

I am an Australian who is passionate about the protection of our unique and precious animal species. I am therefore hugely opposed to this project as it will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

Diversity of species is vital to ensure the ecosystems of Australia and the world are functioning. These ecosystems greatly contribute to all we humans require in order to exist at all on planet earth.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Water wars are looming, they must be avoided through conservation of all possible water supplies.

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

No financial sum will ever equate to the loss of the precious natural environment and this gas project will do irreparable damage to natural environments.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

We have no right to damage the natural environment future generations are to inherit from us.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers.

Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Megan Saw

Subject: No more gas

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 1.5°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks. Electrically powered household and commercial heating, cooling and cooking products are far more efficient than gas powered products, so reducing gas consumption is a better strategy than mining more gas.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I ask the Independent Planning Commission to reject this project for reasons to do with climate change.

It is generally realised that we need to keep global warming to below 1.5C to assist our neighbours in flood prone Pacific Islands by reducing the impact of sea level rise due to increased warming and melting of icebergs.

The increased release of carbon dioxide and methane (gasses which increase global warming) will only make it more difficult to keep global warming below 1.5C. I think it is evident that opening up more gas fields to release more carbon dioxide and methane will make keeping global warming to below 1.5C more difficult than it need be,

Yours Sincerely,

Maurice Oxenburgh

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Jill Mckie,

Subject: Gas Project = unnecessary horrifying stupidity

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

Recently looking at Google Maps of the Pilliga region I was aghast and horrified that the only small remaining remnant of forest in the region has already been damaged and is under further threat from CSG fracking.

Australia is one of the world leaders in deforestation and animal extinction and is clearing trees at the greatest rate since before WWII. We know better, yet we continue to be swayed by the financial interests of corporations.

We continue to be one of the world's biggest exporters of fossil fuels despite soaring temperatures, extinctions, bushfires, droughts and other climate change related disasters.

It is an absolute disgrace that this project is even seriously being considered. It's time (but 30 years too late) to listen to the scientists. Fossil fuels including gas are a loss making industry, causing irreparable damage to our home, to line the pockets of a select few at the expense of everyone else.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Geoffrey Nott,

Subject: Action to preserve the Environment must start now!

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

Apart from burning of the gas fugitive methane emissions are likely to be underestimated.

Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

More threatened species will be impacted and Australia already has a despicable record already in regard to extinction of fauna and flora.

It is reported that Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

While engineering has improved cross contamination of aquifers, there is no certainty. Errors do happen and in the case of deep drilling adverse outcomes will be irreversible.

In order to actually protect Australian businesses and households from gas supply shortages as a result of not proceeding with Narrabri project governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Max Smith

Subject: A Submission of Objection to Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission about the Gas Project proposed near Narrabri.

I give permission for my name and submission to be included on your website.

I strongly object to the proposed Narrabri Gas Project. I am asking the Independent Planning Commission to reject this project.

There are many concerns about Coal Seam Gas, and it's impact on Communities and our natural world.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers.

Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from power supply shortages, governments should help them to get off gas and coal by promoting sustainable power sources.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Ruth Shepherd

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

When will enough be enough? Will it be when every part of this beautiful planet has been developed in some way?

Yours Sincerely,

Margaret Heagney

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

Subject: The Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

The Narrabri coal seam gas project will tear through a forest that is a priority area for koala conservation and home to two rare, iconic and critically endangered bird species — the swift parrot and the regent honeyeater.

It will remove 1.5 gigalitres of water each year from the Great Artesian Basin, threatening the water supply of local farmers who rely on it for stock and crops.

And it will release 94.2 million tonnes of potent climate pollution during mining and when the gas is finally burned.

We don't need coal seam gas as we transition to less greenhouse producing forms of energy. We have the technology already to reduce green house gases - renewables.

an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

1 We are already the largest gas exporter in the world and yet receive no royalties or access to this gas supply. To supply NSW with gas by digging up more doesn't make sense in this context.

2 Any threat to any forest in NSW should be considered to high. If one looks at a satellite image of NSW it can be seen that there is hardly any forests left except for small pockets especially in the region west of the Great Dividing Range.

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply. To provide a viable cost effective for the consumer how many more projects will have to be developed

Yours Sincerely,
David Harvey

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Phil Malcolm,

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

1 We are already the largest gas exporter in the world and yet receive no royalties or access to this gas supply. To supply NSW with gas by digging up more doesn't make sense in this context.

2 Any threat to any forest in NSW should be considered to high. If one looks at a satellite image of NSW it can be seen that there is hardly any forests left except for small pockets especially in the region west of the Great Dividing Range.

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply. To provide a viable cost effective for the consumer how many more projects will have to be developed

Yours Sincerely,
David Harvey

Dear Sir/Madam,

I have just read through this submission and I would like to add one thing. We humans have been so lucky to have gotten away with continual destruction of this world that we live in/on so far. But now we have started to destroy irreversibly the whole fabric of how nature operates. The oceans, the waterways and the very land that we rely on to keep us alive as a race. No wild animal or native races have been as greedy as we humans of this moment. IT HAS TO STOP RIGHT NOW.

I am writing to make a submission on the Narrabri Gas Project.

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

We are most concerned about the impact on the water table. Our water is going to be most precious as the climate heats.

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

Subject: Objection t Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep coal and gas in the ground and stop burning it.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers.

Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

Economic

The world is currently facing a major over-supply of LNG, a huge depression in the price of LNG, and a huge drop in value for LNG projects. It is entirely possible that, after creating massive destruction to our environment, Santos may simply declare the project unviable and bankrupt, and walk away. We (Australia) will be left with the cost of cleaning up.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Roger Caffin,

Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Graham Warburton,
2428

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Risk of polluting drinking water
Climate impact
Less water for farming
Habitat destruction of fauna and flora

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Subject: Submission in response to proposed CSG build in the Pilliga forests

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My main concerns are listed below.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

Koalas

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Considering the koala population decimation from the 2020 bushfires I would think conserving this national species of utmost importance for future generations.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

Climate

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Please think again - we can't go back and change this.

Yours Sincerely,

Sue Pears

Subject: OBJECTION to the CSG Project in the Pilliga Forest

Follow Up Flag: Follow up
Flag Status: Completed

The Commissioners...IPC.

I wish to lodge my objection to this planned CSG extraction by Santos in the Pilliga Forest.

The area is almost untouched wilderness, and the habitat of much iconic Australian wildlife that is under threat everywhere.

Habitats destroyed will never be restored!!....and the wildlife and forest will not return in any foreseeable future.

In addition, the 850 CSG wells will drive through the Great Artesian Basin, going to a deep coal seam in the stratas beneath the Artesian water that the outback needs for survival.

There is an almost certainty that wells will leak/break/misalign and create contact-exchange between stratas..... No geology is stable for year after year of gas and water extraction....and ground movement(and pipe fractures) are inevitable.

Moreover, the water reaching the surface from the coal seam has been shown to be extremely saline.....and apart from contaminating the Artesian aquifer on its way through the geological stratas, this water reaches the surface with a salt-load for which I have not seen any treatment proffered by the Applicant It is unthinkable that bore drains simply carry this contaminated water into local rivers and waterways AND ALL the recharge areas for the existing Great Artesian aquifer!!

The contamination of the Great Artesian Basin in this project is almost inevitable.....with disastrous results for the agribusiness in the area.

The extraction of gas within Australia's borders is already immense.....BUT most of it is exported at low prices.....which we then have to repurchase for our own needs.

This commercial arrangement is absurd....and a continuation of such arrangements is totally against Australia's economic interests.

I would prefer a revision of commercial arrangements whereby Australia draws its domestic gas supply from the current gas extraction/supply instead of 'exporting and buy-back!!'....rather than extracting more gas and creating another set of irreversible problems for our environment.

I urge you to rule against the extraction of still MORE gas from Australia's Coal Seams.....with all the attendant risks to Australia's environment.

AND INSTEAD, urge the restructure of the current(and disadvantageous) commercial gas arrangements that allow the bulk of our current gas extraction to be exported and lost to local Australian domestic needs.

Yours Sincerely,

David Hindle

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Caitlyn Morrissey,
2357

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear IPC

I am writing to make a submission of objection to the Narrabri Gas Project. My name and submission may be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are detailed below.

1. Climate impact

If we are to have any chance of keeping global warming below 2°C gas must be kept in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy. Fugitive methane emissions are likely underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing further gas sources.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts such as bushfires, drought and extreme heat. One only has to look at recent and current events to see this is already a reality. More gas extraction further increases our exposure to climate change-associated risks.

2. Impact on threatened species

This project will endanger Koalas (*Phascolarctos cinereus*) (vulnerable) and two endangered and iconic bird species - the Swift Parrot (*Lathamus discolor*) (endangered NSW, critically endangered Commonwealth) and the Regent Honeyeater (*Anthochaera phrygia*) (critically endangered).

The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species. The Scientific Committee was of the opinion that the numbers of the Swift Parrot have been reduced to such a critical level and its habitats have been so drastically reduced that it is in immediate danger of extinction in New South Wales (NSW Department of Planning Industry and Environment).

The Regent Honeyeater is a flagship endangered woodland bird whose conservation will benefit a large number of other threatened and declining woodland fauna (NSW Office of Environment and Heritage).

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence. Koala populations have been decimated by recent bushfires, every effort should be made to preserve their remaining habitat, not degrade it.

3. Poisoning and depletion of groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath. This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface. The water from the coal seams has been in contact with coal for hundreds of thousands of years and has absorbed elements that could be harmful if they leak into the irrigation water in aquifers.

Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

4. There is no need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to protect Australian businesses and households from gas supply shortages, governments should promote electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops, rather than relying on gas.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely

Susan Hemsley

Subject: Objection to the Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground. The stabilising and reduction of global temperatures is critical for the future of life as we know it.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species - I am very concerned about the effect of this development on threatened species. The east coast of Australia has already suffered a devastating reduction in our wildlife from the recent fires.

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Howard Wheatley

Subject: Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate Impact.

We must keep Global Warming below 2degrees C to achieve this we must leave gas in the ground. With existing coal and gas fields we are already exceeding globally agreed temperature goals. There is no need for more gas. The rapid development of renewables and battery storage capacity make renewable energy sources cheaper.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

I live on the Far South Coast bushfires devastated our area we are still in drought we must take action on Climate Change Gas is not the answer.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

Subject: Coal seam gas extraction technology is outdated and too risky..`

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

"Climate impact" ...

Currently, CSG production has too many risks involved ... CSG is a natural resource and one day in the future Australia may need this energy source but only when the technology has improved **Just because the CSG is there doesn't mean we have to use it now it isn't going anywhere

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.
