This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Brian Wilcock,  
2517

**Subject:** I object to the Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project. I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers.

Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

**Sent:** Friday, 24 July 2020 5:28 PM  
**To:** IPCN Enquiries Mailbox  
**Subject:** Protect our Forest.

Dear Sir/Madam,

I am writing to make a submission in regards to the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask that the Independent Planning Commission reject this project. My reasons are listed below.

Climate impact:

If we are to have any hope of keeping global warming below 2°C we must keep this gas in the ground.

This gas field could potentially release at least 94.2 million tonnes of pollution during mining and when the gas is burned for energy. Methane emissions are also likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room or need for any more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bush fires, drought and extreme heat waves. More gas extraction is likely to increase our exposure to climate risks.

Threatened species:

This project will endanger koalas and two other rare and iconic bird species - the swift parrot and the regent honey eater.

The swift parrot is critically endangered, the total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honey eater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater:

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharging of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas:

Almost all gas currently produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Glenn bourne

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Beverley Critcher,  
2519

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

**Subject:** I object to the Santos Narrabri Gas Project

Dear Sir/Madam,

I write to submit an objection to the Narrabri Gas Project.

I give permission for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. These are my concerns:

Climate change is Australia's and humanity's biggest and most urgent threat. The world cannot afford another gas or coal project. If we are to have any chance of keeping warming to below the 2 degree threshold, we cannot afford even the coal and gas fields currently in operation.

We don't need another gas field. Renewable energy technology is racing ahead and capable of providing all of Australia's energy needs. It provides many times more employment than gas or coal and leaves no environmental destruction in its wake. Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. If more gas were needed in Australia then the gas companies should not be allowed to export as much as they currently do.

This project will impinge on the habitat of several endangered species, including koalas and two rare birds, the swift parrot and the regent honeyeater. I want my grandchildren to know koalas as more than some archaeological curiosity.

This project will poison and deplete groundwater, and bring ancient, contaminated coal seam water to the surface. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

There is nothing to recommend this project. It takes Australia one more step towards climate catastrophe, all for the profits of a wealthy company.

Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Christine Wheeler  
2785

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project.

The only benefits of this project appear to be profits to the company Santos. Santos was ranked the 4th worst tax dodger in Australia last year ( Michael West Media). It had a total income of \$14.9 billion (over four years )and just \$ 3.1 million tax payable, ( over 4 years) .It also has US\$1.75 billion in deferred tax assets to offset against any future profits.

The risks of poisoning our water or permanently damaging the Great Artesian Basin are great. The project will use a great deal of water. Surely the people living on the driest Continent should preserve and protect the water we have.

The Pilliga has it's own natural beauty and is home to our unique Australian flora and fauna. After the devastating bushfires earlier this year where billions of creatures died, ( Sydney Morning Herald) you would think any country that cared for its wildlife, would do all it could to cherish and conserve the wildernesses that remain, not drill holes everywhere to dig up and export a fossil fuel that will just hasten global warming.

To combat climate change we should leave fossil fuels in the ground. We have better alternatives.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Catriona Goodwin

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Jan Hodge,  
2011

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

**Sent:** Friday, 24 July 2020 6:05 PM  
**To:** IPCN Enquiries Mailbox  
**Subject:** I object to the proposal - Santos Narrabri Gas Project

To Whom it May Concern,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project.

My concerns are listed below.

Climate impact.

Water quality neutral or beneficial water quality outcomes cannot be achieved by destroying aquifers.

Gas and associated minerals are toxic to the environment and if wells are put in place to extract the water, the associated minerals including salt and gas will leach into surface water runoff and aquifers, the land of NSW will be adversely impacted forever by leachates.

The cultural landscape surrounding Narrabri has important stories from the Dreamtime that relate to greed and its consequences for the land and society.

The landscape has been exploited for the past 200 Plus years of occupation by the Governments of Britain, NSW and Australia.

We must now act together in the public interest to protect the environment in NSW and allow for healing of country through good land stewardship.

I travelled through the land and region of NSW that this proposal is planned to be establish in, it was during the summer Bushfires in 2019.

I believe a gas field is the last thing we need in this International climate emergency and the impacts on the climate from pollution are real, all the land on the South Coast of NSW where I live is now burnt and recovering from the dry that was the worst I've seen.

The Arctic was 38 degrees Celsius this northern summer and Siberia, the amazon and Australia have all been burning.

We as people and societies are in real trouble. This proposed project in Narrabri will release more gas and burn more carbon and methane internationally to approve this is ignorance, greed and negligence so please act in the public interest and protect the environment in NSW. Please do not approve this gas project in Narrabri.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

#### No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

May you all be reminded of the truth that whatever decisions we make either heal or harm. It is obvious that this project will only harm the water, the environment, air quality, people's lives. If we harm by any means we will experience that harm coming back to us - how does that feel?

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Susan Wilson

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

**Subject:** Please stop the Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. This is my main concern, as we still do not know or understand enough about the Great Artesian Basin aquifer to justify interfering in it with any coal-seam gas project. But we do know that local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Owen Bailey,  
2281

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Claudia Koller,  
2294

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,  
Caroline Lewis-Hughes,  
2477

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project, I may not live in Australia but I love your beautiful country, its people and wildlife.

For your family, and people you love, make the decision that saves your countries beauty, and the planets future, for them and future generations. Save the Forests and the ecosystems within them as they are all part of the circle of all life, providing the lifeblood for our existence as human beings. Please save the forests and look to using safe renewables, wind, solar and water, don't be sucked in by someone else's greed, ignorance or stupidity. Thank you.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Threatened species

Human lives will go on without this and the difference to our economy will be slight enough for most of us not to even notice. To put that very small human advantage ahead of the lives and habitat of our rapidly disappearing wildlife and specifically the wild species who currently call the Pilliga home, is so arrogant and shortsighted, it's heartrending. We will survive without it. The wildlife will be gone as if they were of no consequence.

Specifically:

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

{Mary} {Marlow},  
{2785}

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear members

I am writing to make a submission on the Narrabri Gas Project with my name and submission to be included on your website compulsory.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species like koalas are particularly vulnerable to extinction.

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

**Subject:** Queensland

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

I still think it is all about money and developers and government are not listening.

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground. Climate change is real. Look how much clearer the sky was when we were all in lock down and traffic quieter. It did not take long for a difference to be noticed.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species; Australia is one of the worst countries in not managing its threatened species.

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission. Listen to the people who live there.

Yours Sincerely,  
Sylvia Whiting OAM

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Kaye Cook,  
6148

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Esther Bird,  
2305

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Justine DOdd,  
2453

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

The Narrabri Gas Project is madness. It will poison groundwater, desecrate Indigenous heritage sites, contribute to global warming and threaten at least three species of native fauna.

Please do not cave into pressure from Santos and the fossil fuel lobby.

Australia can be much more than a site for fossil fuel extraction. To ensure a habitable world for your grand-children please reject Santos' Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. The grounds for objection are detailed below:

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

**Subject:** Submission objecting to the Santos Narrabri Gas Project

Dear Sir/Madam,

I wish to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project in the Pilliga region, and ask the Independent Planning Commission to wholly reject this project.

As you are hearing through the Hearings process, the risks presented by this project are immense. Now is the only opportunity to keep this dangerous genie in the bottle. This proposal may be for 850 wells, but Santos' own plans reveal a desire to expand their wells and operations right through to the Queensland border.

#### Dangerous by-products

CSG mining creates an enormous amount of highly toxic waste, particularly salts, for which there are no acceptable ways to dispose of. Bicarb soda production is dubious and inadequate. Santos have previously been found spraying toxic waste onto roads for "dust suppression", which simply spreads the contamination further.

#### Climate impact

The contribution of burning gas to greenhouse gas emissions is not insignificant. This project will continue to pump climate warming gases into the atmosphere. This must be stopped if we are to have a chance of slowing climate change.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Rob Mitch,  
2002

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

**Subject:** Submission objecting to Santos Narrabri gas project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I would like the Commission to take account of my objection to this project.

My objection is based on the current and escalating danger of climate change, not only in Australia but for the whole planet. Also, the real requirement that we safeguard our environment for our children and those to follow.

This planet is rapidly becoming uninhabitable, and every new fossil fuel mining activity makes this happen faster and more deeply.

And finally, the Pilliga forests are unique and irreplaceable. This is not a suitable site for any commercial activity.

Yours Sincerely,

Christopher Barclay,  
4555

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Tanya Peck,  
2160

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

My family (the Walls) has farmed and lived in the Narrabri region for many generations and I know this region well. I look at the proposed coal seam gas project with deep distress as I know the profound degradation of that habitat and water supplies it will have.

I am writing to make a submission on the Narrabri Gas Project and I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. I support the communities objections to then project and emphasise again the following concerns that have not been seriously considered or heeded by the projects planners to this date.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

**Subject:** No CSG for Pilliga!

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project.

**CLIMATE IMPACT:** If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

**THREATENED SPECIES:** This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

We all know how thousands of koalas died during the recent bushfires and so much habitat was destroyed for those remaining. There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

**POISON AND DEplete GROUNDWATER:** Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

Local communities rely on this supply for water for stock, domestic and irrigation purposes.

**NO NEED FOR MORE GAS:** Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Katja Jezewski,  
12435

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project. I do so as President of the Australian Institute of Ecological Agriculture Cooperative Ltd. The AIEA exists to ensure that farming does so with due recognition of the ecosystems and their in producing food and fibre. If farming practices or mining practices do damage to the ecosystem then we oppose them. Given climate change we need to create an alternative approach to decision making that considers the needs of all species. It is the context of this overview that I sign this letter and approve of the issues below.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

{Dinah Mackay},  
Bd212hn

**Subject:** Objection to Santos Narrabri Gas Project

Dear Sir/Madam,

As a woman originally from the Northwest of NSW I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened individuals and species

From an ecological point of view this project will endanger koala species and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

As well as the biodiversity loss of not protecting these species we must also consider the pain and suffering of animals displaced, injured or killed through the process of setting up the mine or through its ongoing operation, should it go ahead (see more below).

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project based on the potential destruction coal-seam gas has on the environment and the risk to Australia's water resources.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment.

Yours Sincerely,

Donald Fraser

**Subject:** Submission of Objection to Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated. Methane is much worse for the ozone layer than carbon dioxide.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks. This is the driest continent and the water belongs to all Australians.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops, solar power and batteries.

Aboriginal cultural sites are not properly protected by law so no matter what the company says, there can be a "misunderstanding" and the sites can be legally ruined.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Miranda Johnson

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Dinah Beggs,

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

**Subject:** Please Select...

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks. Surely, this is well illustrated by the recent disastrous fires.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence. To endanger these species further is dangerously reckless.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours sincerely  
Stuart Gray

**Subject:** Environmental Vandalism: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

Developing new gas fields will be devastating to our environment and climate. Reducing global warming should be our focus now, not increasing it.

Both the process of the mining and the use of the gas produced will pollute our climate and increase emissions. These negative impacts will not lead us into a cleaner, brighter, more sustainable future. Instead, our climate vulnerability will be intensified.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

The extraction of groundwater necessary for this mine will bring additional devastation to this region. This removal will most likely contaminate the irrigation water in the aquifers, as well as disrupting the Great Artesian Basin. This damage will not be reversible and will affect local communities who rely on this supply for water for stock, domestic and irrigation purposes.

So who will benefit from this mine? Certainly not the local people, or the environment - the flora and fauna, now and into the future, or even the general Australia population. In fact, the negative impacts of this mine will far outweigh any benefit from the expensive gas that will be produced.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I completely concur with all the arguments put forward by people more knowledgeable and even expert in this area than I am. I have therefore added my name to the material copied below. but I wish to add that I have visited the Pilliga Forest, so can also speak from a little personal experience. I remember it as a peaceful and beautiful place, distinctive because of the local flora of Callitris trees (native cypress) which were abundant at one time, but have proved to be such useful timber that they have been harvested for over 100 years for use in building and carpentry. The remaining resource should be conserved and carefully used in future, mainly through plantation cultivation. The proposed gas mining project would have devastating effects on these precious remnant forests, as well as damaging and reducing underground water supplies. Such mining ventures are no way to revive the economy as they create few new jobs for the increasing numbers of unemployed, and benefit only a small number of already wealthy people.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

#### No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Nicola Coles  
{3071}

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Rhianna de Raad,  
3118

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

We MUST protect the wildlife we have left.  
We have lost too many of them already.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project.  
My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Vicki Luke

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

**Subject:** Santos Narrabri Gas Project - STOP

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Planet Earth has reached an existential crisis point whereby the continuation of fossil fuel extraction from the earth, and its subsequent burning, will render the planet uninhabitable. That is, Mankind will perish. This is a fact recognised and communicated by the majority of the world's climate change scientists.

So, the question has to be asked of the executives and shareholders of Santos, why would you risk the opportunity for your children, your grandchildren, your great grandchildren, and their children, to have a happy, healthy, prosperous life the same as you have had ?

Economic growth and prosperity cannot rely on the the extraction of hydrocarbons infinitely because the world's resources are finite. And the science has shown us that to try and utilise all hydrocarbon resources indefinitely will essentially terminate life as we know it.

There are other energy sources we can use to support our lifestyles that will not kill the world. The utilisation of these other energy sources have been well documented.

Santos, and others, must review the possibilities and opportunities to save the future for their immediate and future families, and for the world community.

If Santos executives have any sense of morality they really need to stop their current plans for gas extraction in the Pilliga and to find a more sustainable path to the future. And as greed appears to be the motivating force you will be happy to know that you can make great fortunes out of utilising the new technologies and energy sources. Its a win/win situation.

Yours Sincerely,

{David} {Hall},  
{2089}

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Robert Scobie

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

**\*\*Climate impact & bushfire consequences**

Do you want to be sued for contributing to the next lot of bushfires?  
Do you want to know you directly contributed to another bushfire season?

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

**\*\*Threatened species**

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater. As well as kill millions of animals that live in the trees, ground, water & air and call this region HOME.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

**\*\*Poison and deplete groundwater**

We know from past experience that the groundwater is severely affected.

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic, irrigation AND DOMESTIC purposes ie it WILL affect people's health & day to day lives.

**\*\*No need for more gas**

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Sandra Orme

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

I feel despair every time I hear of more coal seam gas projects.

What will remain of our beautiful country if it becomes just a giant gaping hole of mines, bereft of life and beauty.

I want a future for my children and grandchildren.

Yours Sincerely,

Julienne Lynch

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Honorable+Tiffany Snyder+-+Mayor+of+Ward,+Colorado+(Ret.),  
80305

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Patrice Wallace,  
95060

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project. While I am using points supplied to me in this objection, do not take that to mean that I do not feel very strongly about this issue: I do, and in particular the risks to the pressure of the Artesian Basin, upon which farmers depend right down into South Australia. I spent more than 35 years in agribusiness and will take this sustainable industry over any wasteful, polluting short-term idea such as this stupid gasfield. Damage will be irreversible.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

**To:** IPCN Enquiries Mailbox  
**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

My submission on the Narrabri Gas Project follows.

I am happy for my name and submission to be included on your website.

My submission is in regard to a complete REJECTION of the Narrabri Gas Project and I make a plea that the Independent Planning Commission will reject this project. My concerns are as follows:

Climate impact - we must keep gas in the ground if we are genuinely concerned about the future Generations and our earth.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining . When the gas is burned for energy, the fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals.

Is there a real need for more?

The rapid and ongoing development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will ENDANGER already threatened koala and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundWATER

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

NO NEED FOR MORE GAS.

Almost all gas produced in eastern Australia is EXPORTed via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

I Therefore strongly object to the Narrabri Gas Project.

Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Sue Frazer.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

adrienne pollock,  
8505

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project. I object to the project and ask that it be rejected

My concern is simple. If we do not have a healthy, functioning and sustainable natural environment we have nothing. Everything that we grow, extract, develop, construct, eat comes from the natural environment. We must do everything we can to preserve it and this means avoiding anything that can destroy or compromise our ecosystems, our water or our way of life.

It is for these reasons that I object to the Narrabri Gas Project.

Regards

Robert Sullivan

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Roslyn Lane,  
4221

**Subject:** Submission of Objection: there must be an alternative to this environmentally destructive development

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

1. Why is Australia, the worlds largest natural gas producer/exporter, with huge undeveloped reserves of gas elsewhere – e.g. in Gippsland - even considering a gas development in one of the continent’s most significant remaining natural areas – the Pilliga Forest – to produce even more gas?
2. Construction of hundreds of kilometres of roads, 850 gas wells, extraction of large volumes of groundwater, bright night lighting and other associated impact will effectively destroy this natural area. Similar gas developments in forested areas in Central Qld can be inspected to see what the transformation will look like. It is shocking to see and will permanently degrade the areas capacity to support biodiversity.
3. Australia biodiversity like the world in general is in decline. The only way to arrest this alarming process is by conservation of good sized chunks of remaining natural habitat, such as the Pilliga Forest.
4. Conservation of biodiversity is not just about conserving threatened species – its about conserving whole natural ecosystems and the myriad of species existing within them. These systems cannot be recreated once destroyed or degraded by roads, power lines, storage areas, pumping water from underground, night lighting, road kill, run-off chemicals leaching into waterways and soil, the list goes on. A plantation (so called biodiversity offset) is not the same as a natural ecosystem.
5. This natural environment of major significance, due to its large size and wealth of flora and fauna, should not be sacrificed to supply gas to the domestic market because governments were too greedy for tax revenue, and short-sighted, to put some of the vast amounts of gas being exported aside for the Australian market. The gas should be sourced from other large reserves elsewhere that will not have devastating effects on the natural environment – e.g. other offshore gas fields, inland basins, Gippsland.
6. The cost of gas to the consumer will probably remain the same so we might as well just keep on sourcing it from where ever it comes at present - re-purchased from the export market.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

**Subject:** Protect the Pilliga Forest - reject Narrabri Coal Seam Gas Project!

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Rachel Loui,

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Kelly Gilgen,  
2325

**Subject:** OBJECTION...WAKE UP

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

The Pilliga is important to the to the health of us all. It is a precious expanse of forest in Western NSW, in an area that has been largely cleared for grazing of livestock. Much of the surrounding areas are degraded. The Pilliga gives a place of connection for the local indigenous people. Forest are important to all for restoring balance and health.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

**Subject:** NSW

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Methane is a highly potent global warming emission that is rapidly increasing in concentration in our atmosphere. It has a global warming potential of around 84 - 84 times more damaging than carbon dioxide. This does reduce to around 23 after 100 years but it is a serious risk to the world's climate. The melting of permafrost in the Arctic Circle is increasing rapidly with global warming and may cause a "tipping point" where the escaping methane heats the atmosphere causing more methane to be released causing more heating and the cycle continues at an ever increasing rate that is likely to be impossible to stop.

Methane has recently been discovered leaking from the floor of our oceans following rapid increases in ocean temperatures.

"Fracking" breaks rock strata to release methane gas. "Fugitive losses" of methane gas cannot be properly forecast or controlled.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields are already pushing the world past globally agreed temperature goals. There is no room, or need, for more. There is a world oversupply of gas at this time.

The excessive mining and export of gas in Australia has led not to cheaper gas prices but to our domestic gas being the most expensive in the world. This has caused the loss of industries dependant on gas. Why should we allow mining companies to mine more gas to the detriment of the world.

The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas and will provide more clean jobs to assist with our economic recovery from the depression that we are entering into.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, droughts followed by flooding rains, rising ocean temperature destroying the Great Barrier Reef and extreme heat.

Gas is not a "clean fuel". Even if we ignore fugitive losses of methane during its production, it adds significantly to global warming. In addition, fracking brings thousands of tonnes of salts to the surface and this will poison our lands for centuries into the future.

This project has the potential to permanently damage the Great Artesian Basin, the largest artesian water supply in the world. This supplies farmers with the essential water that they need to farm in our sunburnt country. A bit more gas is not worth the risk to Australia, its people and its economy.

Australia is leading the world in mammal extinctions and the number of threatened species, both plant and animal, is rising rapidly.

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Emma Garison,  
4865

**Subject:** Submission of Objection: Santos Narrabri Gas Project is harmful.

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project.

Fossil fuels are becoming redundant energy sources and no new gas projects or exploration nor coal mines should be being considered or approved.

My main concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Robin Humphrey,  
2777

**Subject:** Protect the Pilliga- Keep gas in the ground

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Alison Stewart,  
2066

**Subject:** No to the proposed Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

**Subject:** Submission of Objection: STOP Santos Narrabri Gas Project

Dear Sir/Madam,

This is my submission to you, to STOP the destructive Narrabri Gas Project. I trust you will put the health of humans, forests, land, air and water before money, poison and destruction.

I am happy for my name and submission to be included on your website.

I strongly object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### CLIMATE IMPACTS

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### THREATENED SPECIES

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### POISONING AND DEPLETING GROUNDWATER

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

#### NO NEED FOR MORE GAS

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Peter van der Vlies,  
2110

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

**Subject:** Submission of Objection: Santos Narrabri Gas Project Request

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project.

I am deeply concerned and troubled, for if this project will go ahead it will have detrimental impacts, furthering the effects of global warming, it will further threaten wildlife such as koalas and rare bird species, whose numbers are already dwindling from our horrific fire season and there will be poison and depleted groundwater.

Furthermore, there is no need for more gas.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Naomi Woodpower

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Robyn Mill  
Educator

**Subject:** Submission of Objection: Santos Narrabri coal seam gas project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri coal seam gas project.

I am happy for my name and submission to be included on your website.

I object to the proposed Santos coal seam gas project in the Pilliga forests near Narrabri and ask the Independent Planning Commission to reject this project. My concerns are as follows:

1. The impact on global warming

If we are to have any hope of keeping global warming below 2°C we must stop burning fossil fuels. The gas must therefore be left in the ground.

This gas field could release at least 94 million tonnes of potent climate pollution during mining and when the gas is burned for energy. Fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle global warming. Australia is highly vulnerable to the impacts that global warming can have like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

2. The threat to some animal species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

3. The potential to poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

#### 4. There is no need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops. Of course, I believe it should be mandatory to install photovoltaic cells on all new builds and there should be more financial subsidies to persuade existing houses to install PV systems.

For these reasons I strongly object to the Santos coal seam gas project at Narrabri. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Julian Bradbrook,

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Jessica Doyle,  
2086

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Climate impact

Climate modelling indicates that we do not need gas as a transition fuel to a 100% fossil free future. If we use gas now or in the near term it will increase climate change impacts, which will make it even harder and longer to reverse.

Yours Sincerely,

David Roland

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

nikki dolan,  
2480

**To:** IPCN Enquiries Mailbox  
**Subject:** Submission to IPC on Santos Narrabri Gas Project

Dear Sir/Madam,

I hereby make a submission to the IPC on the Santos Narrabri Gas Project.

My name and submission may be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground. Although gas is often characterised as "clean" or a "bridge" to the renewable future, this claim fails to recognise that gas is a fossil fuel and warnings from the IPCC in 2018 gave us only 12 years (then) to reduce carbon emissions by half. It is well past time for Australia to embrace targets commensurate with our status as one of the richest countries on earth. Additional gas will not help us do that.

Moreover, methane leakages (fugitive emissions) during drilling and transporting make gas far less "clean" than is claimed by the gas industry.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. It is not in our national interest.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence. Given the large additional declines in koala populations that resulted from the black summer bushfires, we need to preserve all habitat that we can.

#### Poisoning and depletion of groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed. At the same time, it will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers or are spilled from holding dams.

Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer itself. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

Although public attention is riveted on the pandemic at this time, global warming is an even greater threat to the future of human civilisation. History will show that projects such as the Narrabri gas project are ill-advised.

It is equally true that escalating loss of biodiversity will also impact on human futures. We know that about half of all birds, animals, reptiles and fish disappeared in the last 50 years. Although this does not refer to the loss of species, it has reduced populations and smaller populations are more vulnerable to extinction.

For these reasons I strongly object to the Narrabri Gas Project. I therefore ask the IPC to reject the Narrabri proposal.

Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Dr Kerryn Higgs  
2446

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply of water for stock, domestic use and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

{Bert} {Jenkins},  
{2350}

**Subject:** Submission of Objection: Santos Narrabri Gas Project

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

**Subject:** Absolute ban on shale gas fracking

Dear Sir/Madam,

As a geologist I am well aware of the dangers of shale gas fracking to further drive climate change. I am particularly concerned that fracked coal seams will keep releasing methane when methane is no longer collected for commercial purposes. Once fracked the release cannot be stopped, when methane is no longer collected it will keep diffusing through the seams and overburden and will further disturb the CO<sub>2</sub>-equivalent balance.

I am writing to make a submission on the Narrabri Gas Project.

Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Irina Blackmore,  
2100

**Subject:** WA

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely

on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Peta James

**Subject:** Submission of Objection: Santos Narrabri Gas Project  
**Date:** Monday, 13 July 2020 9:24:29 PM

---

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Australians need training and expertise and jobs in renewable energy industries to have any chance of competing in the world.

While Australia continues to invest in outdated fossil fuel industries, this government is preventing thousands of Australians from being employed in much longer term globally recognised industries.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I object to the proposed Narrabri Gas Project for the following reasons:

- Increases atmospheric Co2 levels from burning fossil fuels resulting in predicted catastrophic climate change
- destruction of habitat for wildlife, some of which are endangered
- the use of valuable groundwater that is required for food production, especially during drought conditions
- potential pollution of water required for agriculture
- the unconscionable ongoing behaviour of the fossil fuel industry in its ruthless pursuing of profits over the best interest of the people and natural environment

Yours Sincerely,

Georgina Coghlan,  
2543

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Finally, the argument that Australia is helping other countries reduce their emissions by exporting gas is fallacious; the world would benefit far more from a concerted effort to develop and export renewable energy technologies and products.

Yours Sincerely,

Neroli Needham,  
{6537}

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Eilish Watson  
Geelong, Victoria

---

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

Understandably the Government is attempting to ensure economic and energy stability over the coming years. This is an excellent initiative. Sadly, this ruse is misguided in this project from impact upon artesian waters, climate, threatened species, and the balance of the principles of environmental protection with sustainable energy policy.

Yet another call to action over a threatened Australian icon which will be driven into extinction by a projected 2050 arrived again in my inbox - the koala. What lessons have we learned from this? What are environmental scientists indicating as being the major threat? Destruction of habitat. Are there minimisation, revegetation, biobanking strategies within a robust EIS that address this? Even if this is the case, nothing comes a close second to what is present now.

There must be a sensible and calculated balance between the economics of providing energy sources for the future and preserving and maintaining the ecosystem within our capacity. Surely both can be achieved if ego is placed aside. Many European countries have the "smarts" to achieve an intelligent forward thinking balance beyond a short to medium term deficit of (insert any issue here), and the length of a few electoral terms.

Along with other strategies such as licensing, the initiative has worked for water by targeting the consumer/customer end of the supply chain, saving ML of water, one of several strategies for maintaining waterway and riparian zone health, then why not apply this to energy?

Better strategies may include targeting the end user with more efficient products, but this debate can rage amongst the policy makers. Investment in the technological sector to stimulate the production of device efficiency may be a more fruitful medium to long term plan, but this is another debate.

There is a parallel that can be drawn from this project and others alike - human impact. Great leadership may see the signs, be well informed by the scientific community, create policy and law to enshrine it within our nation's beliefs and MINIMISE IT!

Any risk assessment will err toward elimination rather than substitution for the hierarchy of control. This can most definitely be applied to this and several other energy projects, and already has in the case of the GREP offered in NSW by the EPA. Harm minimisation. A sterling concept which would be genius to embody for the consideration of this project.

Yes, cleaner alternatives other than thousands of years worth of coal combustion and with it, sulfur, PM2.5, VOC emissions from its utilisation require assessing. Gas is most definitely a viable, "cleaner" option. Education and good policy makers are the answer, then truly informed and balanced decisions can then be made about any project.

And we will feel the pain. The world's greatest living organism is at our doorstep, providing sustainable tourism dollars in another sector, including fisheries.

But in this very instance, the approval will come at a significant cost. What are they willing to pay? My answer to this is they know what they will pay, but they do not know the cost, nor do we. Due and thorough diligence, I say. One impact is not isolated - there is a co-dependency that is well established of a fragile equilibrium. Affect one, and others will fall.

For these reasons I strongly object to the Narrabri Gas Project.

Yours Sincerely,

David Mawer

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Danielle Packer,  
2125

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

It beggars belief that the NSW Government would even consider this project.

Santos will remove 1.5 gigitalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

The long term disastrous affects definitely do not justify the short term gain.

I strongly object to the proposed Narrabri Gas Project and so should you. I ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change.

#### Threatened species

Dear Sir/Madam,

This submission is to show some of the reasons I object to the Narrabri Gas Project

I am happy for my name and submission to be included on your website

I object to this development and ask that the IPC take into account the reasons the local community and many fellow Australians do not want this unnecessary development which will destroy our livelihoods and environment.

This development will hasten Climate Change . After the years of drought and ferocious bushfires no one would seriously develop a project which is unnecessary and dangerous. This gas field will release pollution which will hasten the effects of Climate .change. Technology such as this is not a transition to a renewable economy but a backward step which will damage our communities and way of life. Renewables with battery storage are already developed to make this gas field a total waste of term and it will quickly become a stranded asset. The cost of developing this gas field is so high that SANTOS will need ongoing government support or it will quickly become unviable. Australia has more gas than it needs but unfortunately it is being shipped overseas at prices we ca; only dream of.

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

As part of the. OU with the government SANTOS was to consult widely with the community. They have failed to do this. surveys held over the several years by Lock the Gate have shown that the majority of the community do not want this development . The community overwhelmingly support the development of Renewables with the cheaper energy attracting industry and local employment without destroying the environment.

This country can not reduce the temperature with the coal and gas fields we have at present so why would we develop more . This would be a senseless track to take and will only benefit those involved with the Minerals Council, the National Party etc.

The Pilliga is home to koala populations, endangered bird and animal species and is the recharge zone for the Great Artesian Basin. Why would we put at risk the GAB which is the life blood for so much of Australia..this project is a threat to our farmers and inland communities.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### CLIMATE IMPACT

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground. Given the fires last summer it's mind-boggling that this project is even being considered!

This gas field will release millions of tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

#### THREATENED SPECIES

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### POISON AND DEPLETED GROUND WATER

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

PS just because I don't live there doesn't mean that I never go there. I drive past the Pilliga Forrest whenever I visit my family in Moree. The damage from Santos Gas probing in the area can be seen as can the beauty of the landscape. We need to keep this space safe for future generations.

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

We do NOT live in an economy.

We do NOT live in a society.

We LIVE in an ENVIRONMENT.

Without clean air, clean water and a healthy natural environment to sustain us we have nothing,

Have we not destroyed enough ? Have we not polluted enough ? Have we not had our fair go at pumping the atmosphere, the land and the waterways full of our filthy chemical toxins yet ?

Let the CEO and shareholders of Santos demonstrate the art of eating money. If they are still alive in 12 months we can revisit the debate.

Clean renewable energy is the only way forward and the only responsible legacy to leave future generations.

I also add the following:

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,  
Carmel O'Connell

**Subject:** Submission of Objection: Santos Narrabri Gas Project  
**Date:** Tuesday, 14 July 2020 2:46:42 PM

---

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

Economic Benefit

Gas expansion will have a very low economic benefit to the Australian people. In the midst of a recession we need projects that are going to provide more jobs and that will also contribute to a zero carbon future.

At best gas will only be used for another 10 years before other greener technologies are implemented. I see no point in investing billions of dollars for something that is almost irrelevant when you compare the other cleaner, greener and more economically stimulating technologies that are available.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Vijay Moody-Ratcliffe,

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

Earlier in my life, in the mid 1960's, I was lucky to live in the area. I frequently return to Pilliga to visit friends and enjoy the wonder of the Pilliga scrub/forest. The Pilliga area is a wonderful place which shouldn't be destroyed for short term profit.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

**Date:** Tuesday, 14 July 2020 8:47:58 PM

---

Dear Sir/Madam,

I want to make a submission on the Narrabri Gas Project.

You may include me on your website.

The Narrabri Gas Project must not go ahead.

The Independent Planning Commission should reject this project for the following the reasons:

Toxicity

The potential for water extracted from coal seams to contaminate the Great Artesian Basin aquifer is reason enough to halt this project. The recent droughts have been crippling in their impact. Having an underground water resource not only hydrates the earth and keeps it cool, it also supplies water for local communities, livestock, domestic and agricultural purposes.

Tampering with this ecology is potentially devastating, especially as gas is only considered a "transition" fuel while we seek out renewable sources of energy.

I am confounded that wise government folk cannot see the long term consequences of these actions, and will only make decisions based on short-term short sighted objectives.

Take into account the balance between an irreplaceable woodland wilderness versus the uncertain future of a dwindling market need. The world does not need more gas.  
Even an economist would see the foolishness of placing all one's eggs in this basket.

Let's start some diversification in our generations of wealth and let that trickle down to our future generations.

Let's recognise that there are other goals in life besides this immediate financial gain.

Let's imagine our best possible future,  
one that embraces a vision of something we have not yet seen.

Something that is spoken about in dreams.

A future that includes the swift parrot and the regent honeyeater.

A future that sees our place on earth as guardians, not destroyers.  
Move beyond what you know.  
Take a risk.  
One day you will be proud of this moment.

The moment you stood up and said :

"NO - Let's try something different."

I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Stephanie Luke

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Margaret Corcoran

**Subject:** Objection to: Santos Narrabri Gas Project  
**Date:** Wednesday, 15 July 2020 3:54:56 PM

---

Dear IPC,

The following is my submission concerning the proposed Narrabri Gas Project.

I agree to my name and submission being included on your website.

I object to the proposed Narrabri Gas Project.

I also ask that the Independent Planning Commission reject this project. My concerns about the project are listed below.

### 1. Impact on the Climate

This project gas field will release at least 94.2 million tonnes of potent climate pollution during mining. Further, when the extracted gas is burned for energy, further climate pollution will be added, adding to a cumulative emissions figure which has not been clearly identified, nor is it acceptable given the current climate change scenario we face.

If we are to have any hope of keeping global warming below 2°C we must, among other things keep gas in the ground. This is also important for the needs of future generations who may need this and other fossil fuels in a scenario of resource scarcity, as well as who wish to live on a planet which can sustain them, and other life forms into the future.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat - as has recently been shown over 2019/2020. More gas extraction increases our exposure to extreme climate risks.

### 2. There is no need for more gas

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change.

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

### 3. Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers.

Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

#### 4. The Impact on Threatened Species

This project will endanger Koalas, as well as 2 rare and iconic native bird species - the Swift Parrot and the Regent Honeyeater. I have been following closely the (declining) status of all these species.

The Swift Parrot is classed as Critically Endangered. It's estimated that the total Swift Parrot population is around only 1000 pairs. Habitat loss, as with too many of our declining native animal species, is a major contributing factor in the documented decline of this species.

The Regent Honeyeater has become an icon for birdwatchers in NSW, and I am one of those birdwatchers. I have participated in programs to plant more food (woodland) trees for this species in the Capertee Valley in NSW for example. This Honeyeater is a threatened species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been Koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that State Forest as a priority area for Koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

I reiterate for the above reasons my strong objection to the Narrabri Gas Project.

Yours sincerely,

Debra Little  
2207

**To:** [IPCN Enquiries Mailbox](#)  
**Subject:** Objection: Santos Narrabri Gas Project  
**Date:** Wednesday, 15 July 2020 9:58:00 AM

---

I wish to object to the proposed Narrabri Gas Project and ask that the IPC reject the project.

Whilst the potential benefits of jobs in the bush may be a consideration, the affects of this on our global environment and on the local Pilliga environment is not enough to offset this. Having travelled in the area recently, I cannot believe that this seems to be charging full steam ahead. I even had a dip in the Pilliga Artesian Bore which could come under threat.

My concerns relate to:-

Long term future for gas - Has the longer term viability of such a project been taken into account? This could have a huge impact on a regional country town when all of a sudden, not that far down the track, the gas industry is found to be not all it is currently cracked up to be!

Other major concerns:-

Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps

longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regard to this submission.

**From:** [pallinnancy@gmail.com](mailto:pallinnancy@gmail.com)  
**To:** [IPCN Enquiries Mailbox](#)  
**Subject:** Santos Narrabri Gas Project - objection submission  
**Date:** Wednesday, 15 July 2020 5:27:41 PM

---

Dear Sir/Madam,

Thank you for the opportunity to make a submission regarding the Narrabri Gas Project.

Please include my name and submission on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project.

I strongly support conservation of the Pilliga Forest as so little of this kind of forest remains in Australia. I have visited and camped in the Pilliga a few times in my life and consider that it has high conservation values which belong to all Australians now and into the future.

The various eucalypt species provide nectar and pollen resources for threatened species such as grey-headed flying-foxes, regent honeyeaters and swift parrots. These migratory species are not there all the time but depend of food the trees provide when they flower. Migratory nectar/pollen feeders need to have many options of food sources across the landscape because of variations in flowering periods due to weather effects.

#### Water

Deterioration in the quality and quantity of ground water in the area as a result of gas wells will have impacts on trees and other vegetation in this forest.

Gas extraction is likely to impact water supplies needed by existing agriculture as well as conservation areas. Extraction of water containing salts and other contaminants from the coal/gas seams is very likely to damage surface vegetation as well as contaminate aquifer water. Extraction of gas and water will depressurise the groundwater lowering water tables and damaging the Great Artesian Basin. NSW should be taking a precautionary approach by protecting the Pilliga Forest from any potential damage.

#### Climate impact

It is estimated that the gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated. Australia needs to make strenuous efforts to reduce its greenhouse gas emissions. The best thing to do is to leave this gas in the ground.

Investment in renewable energy is rapidly increasing. NSW Government needs to encourage the switch to electricity as our main energy source for households and industry and transport. The establishment of the renewable energy hubs in NSW is most encouraging and will provide considerable returns on investment, increase jobs in regional areas and provide for manufacturing and value adding to rural produce. All this has greater potential than exporting the gas from under the Pilliga

The extreme and unprecedented bushfires of last summer are an indication of the increasing impacts caused by global warming. Increased greenhouse gases are detrimentally impacting the oceans and leading to ocean heating which is driving more violent storms. Now is the time to move away from gas and coal.

For these reasons I strongly object to the Narrabri Gas Project.

I look forward to hearing from you in regards to this submission.

Yours Sincerely,

{Nancy} {Pallin},  
{2061}

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely  
Rae Rosten,

**Date:** Wednesday, 15 July 2020 2:12:20 PM

---

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

I do agree with all the points below, Companies do not have any empathy with the natural environment and growth and greed drive all these ventures. It is time Australia became proud of the environment we have left, it is little enough.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honey eater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honey eater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Water is a precious commodity especially in a dry continent and it is a public resource.

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cook tops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Sandra Hand

---

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Agriculture

This area supports a strong, important and diversified agricultural area. The fertile black soil plains are highly sought after and grow world class products. The products are as varied and as rich as the people that live here and includes wheat, canola, sorghum and pulses including Faba Beans, Chick Peas, Mung Beans and Lupins. In addition, the Narrabri area is a strong producer of cattle and prime lambs. From a geographic perspective, Narrabri is a hub to the agricultural industry in the region. Narrabri is strategically positioned halfway between Sydney and Brisbane with easy access to road and rail transportation. The current rail infrastructure from northern New South Wales to both Sydney and Newcastle ports allows Narrabri and surrounding Shires products to be efficiently exported to the world. Narrabri is on the radar of large world class agricultural organisations that have facilities within the area. It also has a range of strong national organisations including Namoi Cotton, Auscott Limited, Cotton Seed Distributors and Graincorp. All of these organisations plus a range of others make Narrabri a robust and diversified area for the agricultural industry. It is vitally important to maintain good underground water to support these industries. Coal seam gas is renowned for depleting underground water supplies. For this reason alone, it is vital to reject this project

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I know gas seems like greener energy which it feels like we have to find another way, and put our foot down. There is other energy available, and we do not want to put our pressure natural resources in any additional risk.

Do we even know structurally what removing gigatons of water and coal seam gas will result in structurally a century from now?

In one of the most at risk countries for impacts of a heating climate, I am certain water will our most precious resource.

It's a tough choice to make now, but I believe we have to prioritise protection and biodiversity and fund a future where the energy we utilise is not destructive.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project.

The gas fields will cause massive air pollution and in the process of burning gas to produce energy, enormous amounts of methane will be released into the atmosphere. If global warming is to be kept below 2°C, it is not an option to open up gas fields.

There is no need to use fossil fuels to produce energy in today's world. The NSW Government has invested in a pipeline of large scale energy projects, in particular, solar energy and wind energy which won't contribute greenhouse gases to the atmosphere and push global temperatures to a point where human habitation of the planet will be challenged. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

Intergenerational equity represents a widely recognized principle of international environmental law providing for the preservation of natural resources and the environment for the benefit of future generations. The Pilliga Forest is one of the last remaining woodland wildernesses in NSW. Its destruction robs future generations of their natural heritage.

Sadly, the fragmentation of the Pilliga Forest by roads and pipelines will cause irreparable damage to the fragile habitat of the small amount of NSW remaining wildlife, including koalas and threatened species such as the Swift Parrot and the Regent Honeyeater.

The coal seam gas project will use up precious supplies of water. Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath. Clearing of vegetation will result in the severe disruption to the water cycle, something we can hardly risk in our increasingly dry and hot continent.

I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Catriona Duncan

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Sarah Brennan,  
3123

---

Dear Sir/Madam,

I would like to make a submission on the Narrabri Gas Project and am happy for my name and submission to be included on your website.

I strongly object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are as follows:

#### Threatened species

I have done bush walking in this region and remember it as a beautiful place full of biodiversity which should not be destroyed. This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. **Subject:** Submission of Objection: Santos Narrabri Gas Project  
**Date:** Friday, 17 July 2020 7:46:03 PM

---

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Rebecca Ellis,  
32068

Dear Sir/Madam,

I am Gomeroi Yinarr writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

It is time to end the intentional destruction and dismantling of Australia's RICH CULTURAL HERITAGE and its ENVIRONMENT before its too late. Enough already with intentionally destroying Natural WATERWAYS and mass killing of further Native Australian Flora and Fauna, including the further destruction, dismantling & denying Australia's First Nations people's right to undertake Cultural and Spiritual practices on proposed lands which encompasses access for land management and protection of Lands, the protection of waterways and the protection of flora & fauna, all of which are what the Australian Government should also be protecting.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Jodea Delaney,

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

{Julie } {Porter},  
{2560}

**Subject:** Submission of Objection: Santos Narrabri Gas Project  
**Date:** Saturday, 18 July 2020 3:51:04 AM

---

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

**Subject:** Submission to IPC: Santos Narrabri Gas Project  
**Date:** Saturday, 18 July 2020 5:47:02 PM

---

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project. I am a local and live outside Coonabarabran, close to the Pilliga.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. I have a number of concerns.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated. This is backed up by a recent article in the science publication Nature.

There is no need for more gas as there are now renewable energy alternatives. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

The Pilliga in particular, and Australia generally, is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks. Santos currently flares gas even during high fire danger periods. This is a huge fire risk and very dangerous.

#### Light Pollution

Siding Spring Observatory in the Warrumbungles was established in the 1960s and has been at the forefront of Australian Astronomy for the past 60 years. Dark skies are vital to its viability yet Santos are allowed to have gas flares at their wells which are clearly visible from the Observatory. The Observatory has been a long term employer in the area. This gas project will be a short term employer. Local jobs should not be sacrificed for greed (although there is some doubt as to whether the Narrabri Gas Project will even be viable).

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

The development of coal seam gas in this area will destroy large areas of the forest and produce waste salts which Santos are currently unable to dispose of safely.

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes. This will impact on employment in the area and viability of farms. As I wrote above, local jobs should not be sacrificed for short term greed.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

A NSW State Parliamentary Inquiry report released in February founds that of 16 recommendations by the chief scientist in 2014 only two have been fully implemented. Santos cannot be relied on to follow government safety and rehabilitation requirements.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours sincerely,

Pamela Lee  
Coonabarabran 2357

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Alison Zavos,  
2021

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Jim Knapp,  
2035

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gegalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Nathalie WANGERMEZ,  
22031

---

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Clayton Gavin

**Subject:** Submission of Objection: Santos Narrabri Gas Project  
**Date:** Wednesday, 22 July 2020 7:16:41 PM

---

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

{Karen} {Ledden},  
{4217}

**Subject:** Submission of Objection: Santos Narrabri Gas Project  
**Date:** Wednesday, 22 July 2020 5:07:43 PM

---

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I will start by paraphrasing

"When all the trees have been cut down, when all the animals have been hunted, when all the waters are polluted, when all the air is unsafe to breathe, only then will you discover you cannot eat money,"

It continues to amaze me and cause me to despair when the almighty dollar and big business continue to rape our country until there is nothing left. We are the custodians for future generations - what sort of legacy are we leaving for them?

For a more scientific argument :

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project in view of the following. I know that much of this information is gleaned from elsewhere, however, my expertise is in medicine. So I am using the information that has been gleaned by the experts in this field.

My concerns are listed below.

Climate impact

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

With rapid progression of renewable energy technology - these sources, backed by batteries, are a cheaper, cleaner option than developing more gas.

Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission, however, I would prefer not to get the usual pithy and condescending note indicating that you don't care and have little interest in voters who object.

Yours Sincerely,

Barbara Trytko

**Subject:** Submission of Objection: Santos Narrabri Gas Project  
**Date:** Wednesday, 22 July 2020 3:10:36 PM

---

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

Even the Government concedes it is unlikely to reduce gas prices and the majority of the local submissions are against it - as are those from outside the area.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This threatens the Great Artesian Basin in which many businesses in arid regions rely. As the world becomes hotter and drier due to climate change, artesian water is more essential.

This project will bring ancient, contaminated coal seam water to the surface.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Christa Ludlow,  
2060

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Sarah Altmann ,  
2034

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

Save the Pilliga Forest now!

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

1. The Deliberate destruction and catastrophic loss of our remaining wild Environments and habitats for the Short term profit of a privileged few. Loss of the Regent Honeyeaters and the Swift Parrot to name but a few.
2. The subsequent loss of biodiversity, of our iconic, irreplaceable Fauna and flora including the koala. The contribution this makes to the global loss of particularly our insects and birds. Insect populations have crashed by over 60% globally.
3. Climate impact. I live on a tropical Island in North Qld. We have in 2019 experienced our hottest, driest most fire prone Year ever. Also the highest inundating Tides - above 4 metres - ever experienced.,
4. The loss of our Precious water resources. Is it not enough that our Liberal National Party Politicians Are selling our future water Rights To overseas multi-national companies? The contamination possibilities for the Artesian basin are horrendous. Farming and grazing communities are already suffering the loss of productive land and water resources due to Coal Seam Gas projects as well as serious adverse health outcomes. Food, water and habitats NOT GAS is what is Importmanteaus.

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

No need for more gas

Almost all gas produced in eastern Australia is exported via the LNG terminals at Gladstone. The small amount of expensively produced gas from the project will have negligible impact on domestic prices or supply.

In order to actually protect Australian businesses and households from gas supply shortages, governments should help them to get off gas by promoting electrification, such as heat pumps for hot water, reverse-cycle air conditioning for space heating and induction cooktops.

For these reasons I strongly object to the Narrabri Gas Project. Thank you for the opportunity to comment. I look forward to hearing from you in regards to this submission.

Yours Sincerely,

Mary-Jayne House,  
2261

---

Dear Sir/Madam,

I am writing to make a submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I am 100% opposed to any further coal seam gas projects anywhere. This includes the proposed Narrabri Gas Project, and I ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

If we are to have any hope of keeping global warming below 2°C we must keep gas in the ground.

This gas field will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, and fugitive methane emissions are likely to be underestimated.

Existing coal and gas fields will push the world past globally agreed temperature goals. There is no room, or need, for more. The rapid development of battery storage technology makes renewable energy sources backed by batteries a cheaper, cleaner option than developing more gas.

New gas production is an unnecessary and dangerous step in Australia's efforts to tackle climate change. Australia is highly vulnerable to climate change impacts like bushfires, drought and extreme heat. More gas extraction increases our exposure to climate risks.

#### Threatened species

This project will endanger koalas and two rare and iconic bird species - the swift parrot and the regent honeyeater.

The swift parrot is critically endangered. The total swift parrot population is estimated to be no more than 1000 pairs. Habitat loss is a contributing factor in the decline of this species.

The regent honeyeater has become an icon for birdwatchers in NSW. It is a threatened woodland species whose conservation will benefit a large suite of other threatened and declining woodland fauna.

There have been koala sightings in the Pilliga East State Forest. The Western Woodlands Alliance classifies that state forest as a priority area for koala conservation. Koala skulls have been discovered in the project area, further evidence of their presence.

#### Poison and deplete groundwater

Santos will remove 1.5 gigalitres of water per year by drilling 850 wells through the Pilliga sandstone aquifer (part of the Great Artesian Basin) and into the coal seams beneath.

This removal will depressurise the underground water sources, as well as threaten the recharge of the Great Artesian Basin that they feed.

This project will bring ancient, contaminated coal seam water to the surface.

The water from the coal seams has been in contact with coal for hundreds of thousands of years — perhaps longer — and has absorbed elements that could be harmful if they leak into the irrigation water in the aquifers. Extracted water from the coal seams may contaminate the Great Artesian Basin aquifer. Local communities rely on this supply for water for stock, domestic and irrigation purposes.

**Subject:** Objection to the proposed Santos Narrabri Gas Project  
**Date:** Thursday, 23 July 2020 7:32:12 PM

---

Dear Sir/Madam,

I would like to make the following submission on the Narrabri Gas Project.

I am happy for my name and submission to be included on your website.

I object to the proposed Narrabri Gas Project and ask the Independent Planning Commission to reject this project. My concerns are listed below.

#### Climate impact

Climate experts are in agreement that human activity such as burning fossil fuels is driving climate change towards a catastrophic outcome.

If we are to avoid the worst impacts we must keep global warming below 2°C by keeping gas in the ground.

The proposed Narrabri gas project will release at least 94.2 million tonnes of potent climate pollution during mining and when the gas is burned for energy, without even considering the impact of methane release.

The planet simply cannot afford any new fossil fuel projects if future generations are to have any hope. We have a moral and ethical obligation not to selfishly squander our children's future for the sake of short term profits.

There is not financial, scientific or social need for this project that cannot be met with existing renewable technology which offer cheaper, cleaner options than developing more gas.
