Dear Panel

I have read the latest submission from Santos where the CEO selects which scientific research he is going to accept on climate change. He accepts the Australian government's position on climate change and does not accept that we have to have zero emissions by 2030.

As a practising scientist who accepts the work of climate science scientists, I accept that to avoid the worst of climate change we have to have zero emissions by 2030 not 2050.

Allowing the Narrabri gas project to go ahead will lead to fugitive emissions.

It will lead to scope three emissions as other countries burn the gas and it will lead to more emissions within Australia especially New South Wales.

Please accept that to keep global warming under 1.5 degrees, our emissions have to be down to zero by 2030 .

Under the New South Wales environmental protection act your panel have to consider the effects climate change so please accept the science that most scientists accept, not cherry pick the Science as Santos has done.

Who can forget that terrible day after the months of bushfires when the tv cameras panned down a road and showed all of the native animals and domestic animals lying dead on the road after the fires had swept through. Please to avoid this situation repeating and all the other horrific effects of climate change, locally, nationally and globally, please do not approve this gas project.

Yours sincerely,

Jacqueline Marlow

Kind regards
Jacqui
