

The site at Kings Plains is not suitable for a gold mine.

Regis Resources believe they can construct a gold mine and processing facility on the upper reaches of the Belubula River without causing major damage to the waterway and surrounding pasture land. They are planning to plug up the natural springs and creeks that have fed the river for all time and construct a "Tailings storage facility" of approximately 640 acres on top.

Into this tailings dam will be pumped contaminated mine tailings containing escalated levels of heavy metals and metalloids including arsenic, copper, and zinc.

The fact that there could be an engineering miscalculation, seismic event or severe weather occurrence that could wash this contaminated concoction downstream is completely plausible!

Surely the safest and smartest location for a goldmine incorporating TSG would be nowhere near a River or natural watercourse. This site is completely unsuitable.
